XVIII. CHEMICAL HYGIENE PLAN - SIGNATURE CONFIRMATION
I. Purpose

UConn Health seeks to promote and maintain all programs that support the safety, health, and well-being of employees, students, staff and visitors. To this end, this plan has been developed to protect the health and safety of all personnel working in UConn Health laboratories. It incorporates the requirements of the Occupational Health & Safety Administration (OSHA) standard 29 CFR 1910.1450 (effective May, 1990), Occupational Exposure to Hazardous Chemicals in Laboratories, more commonly referred to as the OSHA Laboratory Standard, and serves as the UConn Health’s written Chemical Hygiene Plan, as required by the standard.

II. Scope and Applicability

The Chemical Hygiene Plan (CHP) applies to all laboratories (campus wide) at UConn Health (not UConn Storrs or regional campuses) that use, store, or handle hazardous chemicals and to all personnel who work in these facilities. For the purposes of this plan, laboratories are defined as work areas where small quantities of hazardous chemicals are used on a non-production basis. It excludes workplaces whose function is to produce commercial quantities of materials. In laboratories, reactions, transfers, and handling of chemicals are designed to be safely carried out by one person. In addition to the requirements of the CHP, work in laboratories involving biological or radiological materials must also comply with UConn Health’s Biological Safety program and The Radiation Safety Program requirements.

The CHP provides a general overview of standard operating procedures, work practices, controls, and personal protective equipment used to protect personnel from the health and physical hazards present in laboratories. It is the responsibility of all individuals working in laboratories to comply with the guidelines of the CHP. In addition, lab personnel must follow the safety manuals, standard operating procedures, laboratory specific operating procedures (LSOPs) and work practices required by departments, principal investigators, and laboratory/facility managers to address procedures and hazards specific to their laboratories.
III.   Enforcement

As stated in the Health & Safety Policy, UConn Health is committed to providing a healthy and safe environment for all activities under its jurisdiction and complying with all applicable federal, state, and local safety regulations and standards. Department heads, principal investigators, laboratory/facility managers, lab workers, and other authorized individuals all share the responsibility for minimizing personnel exposure to laboratory hazards and maintaining compliance with the Chemical Hygiene Plan. Failure to comply with this plan may result in disciplinary measures in accordance with University Laws and By-Laws, EH&S/OVPR Policies and Procedures, General Rules of Conduct for All University Employees, applicable collective bargaining agreements.

IV.   Definitions

- **Active Lab Area** - laboratory areas where chemicals are used or stored.

- **Chemical Hygiene Plan** - a written program developed and implemented by the University which sets forth procedures, equipment, personal protective equipment, and work practices that are capable of protecting lab personnel from the health hazards presented by hazardous chemicals used in that particular workplace.

- **Hazardous chemical** - any chemical which is classified as a physical hazard, a health hazard, a simple asphyxiant, combustible dust, pyrophoric gas, or hazard not otherwise classified (HNOC). A hazardous chemical is identified by the regulatory need for a Safety Data Sheet (SDS)

- **Health Hazard** - means a chemical that is classified as posing one of the following hazardous effects: acute toxicity (any route of exposure); skin corrosion or irritation; serious eye damage or eye irritation; respiratory or skin sensitization; germ cell mutagenicity; carcinogenicity; reproductive toxicity; specific target organ toxicity (single or repeated exposure); or aspiration hazard.

- **Lab Personnel** - department heads, principal investigators, laboratory/facility managers, lab workers, and other individuals assigned to perform specific duties in laboratories where hazardous chemicals are used or stored. This does not include maintenance, custodial, or other workers not actively engaged in laboratory activities.

- **Permissible Exposure Limit (PEL)** - a regulatory limit set by OSHA based on the amount or concentration of a substance in the air. In some cases, it may also contain a skin designation. Most PELs are based on an 8-hour time weighted average (TWA) exposure to which it is believed most workers may be exposed to for a working lifetime without developing serious illness. PELs are enforced as a legal standard.
NOTE: Be aware OSHA has dedicated standards that apply to the 13 identified carcinogens and many potential carcinogens.

- Physical Hazard: A chemical that is classified as posing one of the following hazardous effects: explosive; flammable (gases, aerosols, liquids, or solids); oxidizer (liquid, solid, or gas); self-reactive; pyrophoric (gas, liquid, or solid); self-heating; organic peroxide; corrosive to metal; gas under pressure; in contact with water emits flammable gas; or combustible dust.

- Threshold Limit Value (TLV): The time-weighted average (TWA) concentration for a conventional 8-hour workday and a 40-hour workweek, to which it is believed that nearly all workers may be repeatedly exposed, day after day, for a working lifetime without adverse effect. The TLV is a consensus standard issued by the American Conference of Governmental Industrial Hygienists (ACGIH).

V. Roles and Responsibilities

Individually overseeing or working in laboratories where hazardous chemicals are used or stored are responsible for following the guidelines listed in the Chemical Hygiene Plan. The responsibilities of each position are outlined below:

A. Vice President for Research

- Provides institutional leadership and assumes ultimate responsibility to ensure compliance with the Chemical Hygiene Plan.
- Supplies the UConn Health Chemical Hygiene Officer with the support necessary to implement and maintain the requirements of the Chemical Hygiene Plan.
- Updates the President of the University on EH&S policies, programs, and relevant issues regarding laboratory safety.

B. UConn Health Chemical Hygiene Officer (CHO/CSO)

- Works with CSO to review, update & implement revisions of the Chemical Hygiene Plan.
- Works with departments, principal investigators, laboratory/facility managers, and lab workers to develop and implement chemical hygiene policies, programs, laboratory-specific standard operating procedures, and safe work practices.
- Provides technical assistance to lab personnel regarding adherence to the Chemical Hygiene Plan.
- Manages the UConn Health laboratory training, inspection, and chemical inventory programs.
- Responsible for the training of EH&S staff to assist in laboratory audits and/or CHP initiatives.
- Assists lab personnel in the selection of appropriate engineering controls, administrative controls, and personal protective equipment for hazards encountered in laboratories.
- Works with departments, lab personnel and the principal investigator to continually improve the chemical hygiene program.
- The Chemical Hygiene Officer (CHO) may delegate duties to the CSO to implement the Chemical Hygiene Plan. The CSO has the authority to independently act on behalf of the CHO to implement the Chemical Hygiene Plan and fulfill these roles and responsibilities.

C. Department Head

- Directs lab personnel within their department(s) to comply with the guidelines of the Chemical Hygiene Plan.
- Instructs lab personnel within their department(s) to receive Initial Lab Safety & Chemical Waste Management training and periodic retraining through EH&S.
- Works to maintain an up-to-date list of lab personnel within their department(s).
- Works with principal investigators or laboratory/facility managers, within their department(s), found to be in violation of the Chemical Hygiene Plan or the Health and Safety Policy to ensure timely corrective action.
- Reviews accident reports and works with principal investigators, laboratory/facility managers, lab personnel, and EH&S to make appropriate changes to laboratory standard operating procedures to prevent future incidents from occurring.

D. Principal Investigator (PI)

- Follows the guidelines of the Chemical Hygiene Plan and ensures compliance with all EH&S policies and programs applicable to their labs.
- Ensures that their lab personnel, including the PI, complete Initial Lab Safety & Chemical Waste Management training provided by EH&S prior to working in or overseeing work done in the lab. A refresher course must be completed by all laboratory staff (including PI) every year.
- Minimizes or eliminates actual or potential hazards that could lead to accidents, injuries, or property damage.
- Ensures that lab(s) remain clean, orderly, and in a sanitary condition.
- Ensures safe operation of laboratory equipment through proper installation, inspection, maintenance and repair.
- Reviews and updates the lab’s Workplace Hazard Assessment Form(s) as needed.
- Provides training to lab personnel that addresses the hazards, controls, work practices, personal protective equipment (PPE), and emergency procedures specific to the lab.
- Maintains and documents lab-specific training for lab personnel, including the contents of training and a list of personnel receiving the training.
- Ensures compliance with the UConn Health’s Working Alone Policy.
- Ensures that minors (individuals under 18 years old) will be supervised at all times by qualified laboratory personnel.
- Reviews and approves protocols and procedures of lab personnel for potential safety and/or technical issues prior to active research.
- Provides appropriate personal protective equipment to personnel in their lab(s) at no cost to the employee for the health hazards, physical hazards, and equipment identified in the Workplace Hazard Assessment (WHA). EH&S recommends that work involving reactive, acutely toxic chemicals or “particularly hazardous substances” (PHS) trigger the development of a “laboratory specific operating procedure (LSOP)” and a WHA with submission to the CHO for review.
- Develops and provides training and laboratory specific operating procedures (LSOPs) for lab personnel engaged in research with particularly hazardous chemicals. EH&S has developed roughly 13 LSOPs for such compounds as sodium azide, hydrazine, pyrophorics and osmium tetroxide.
- Ensures that lab personnel properly collect, label, and manage wastes.
- Reports all lab-related accidents/emergencies to UConn Health Public Safety (911) and EH&S x-2723. All injuries and near misses must be reported to your supervisor and EH&S. The supervisor will then contact the institutions third party administrator Gallagher Bassett at 1-800-828-2717 to complete a WC-207 First Report of Injury. Serious injuries (i.e., death, in-patient hospitalization, amputation, or loss of an eye) must be reported to EH&S immediately to allow for compliance with OSHA reporting time requirements. Near miss incidents (i.e., incidents that did not result in injury, illness, or damage, but had the potential to do so given a slight shift in circumstances) should also be documented and reported to EH&S for review or submitted to the UConn Health Employee Safety & Health Committee.
- Contact Facilities Development & Operations x-2125 or EH&S x-2723 when safety showers, eyewash stations, fume hoods, or other safety-related equipment are not working properly.

Provides oversight of laboratory operations to ensure compliance with the UConn Health Chemical Hygiene Plan, Laboratory Chemical Inventory Program, Laboratory Inspection Program and hazardous waste disposal (waste disposal quick sheet). May designate an individual working in their lab(s) to collaborate with the PI to enact laboratory-specific safety policies and procedures. Designation of such an individual does not absolve the PI of the responsibilities listed in this section. The PI is ultimately responsible for ensuring health and safety in the lab(s).
E. Laboratory/Facility Manager

In the absence of a Laboratory/Facility Manager, the PI has the ultimate responsibility to implement this chemical Hygiene Plan, but when there is a laboratory/facility manager appointed by the PI then their duties are identical to those of the PI.

F. Lab Worker

- Reviews and follows policies, procedures, and work practices outlined in the Chemical Hygiene Plan and lab-specific procedures.
- Attends Initial Lab Safety & Chemical Waste Management training prior to working in a lab.
- Stays current with Lab Safety & Chemical Waste Management training by attending initial and completing the mandatory online refresher training(s) annually.
- Read and document training on LSOPs, animal/chemical safety protocols, this CHP and all SDSs for hazardous chemicals utilized and in the case of shared laboratory space, is incumbent that laboratory workers communicate the health and physical hazards to their neighbors.
- Uses engineering, administrative, and work practice controls to minimize exposure to hazards present in the lab.
- Wears appropriate personal protective equipment as specified by their training and in the Workplace Hazard Assessment Form, Safety Data Sheets (SDSs), or other applicable documentation.
- Receives approval from the principal investigator or laboratory/facility manager prior to conducting research involving hazardous chemicals.
- Notifies and consults with the principal investigator or laboratory/facility manager prior to making changes to existing, reviewed procedures. It is important that all procedural changes be reviewed for the potential of impacting both negatively or positively, waste generation criteria. CT DEEP Hazardous Waste Determination Sheet
- Properly collects, handles, labels, stores, and manages hazardous chemicals, radioactive and biological materials and associated wastes. The comingling of any of these waste streams make the entire waste a hazardous waste. Disposal of mixed hazardous waste streams are often quite costly.
- Ensures that lab(s) remain clean, orderly, and in a sanitary condition.
- Reports unsafe conditions and near misses to the principal investigator or laboratory/facility manager and EH&S.
- Adheres to all UConn Health, Departmental, EH&S/OVPR policies/procedures and laboratory-specific safety policies, procedures, and directives.
G. Environmental Health and Safety

- Reviews, edits, and evaluates the Chemical Hygiene Plan annually and as needed.
- Establishes chemical hygiene policies and procedures to protect lab personnel and the environment.
- Conducts Laboratory Safety & Chemical Waste Management training.
- Provides technical guidance and consultation to the UConn Health community regarding work practices, procedures, controls, and personal protective equipment to ensure safe use of hazardous materials in labs.
- Performs fume hood evaluations (annual flow rate/face velocity certification).
- Inspects laboratories/conducts laboratory audits.
- Provides services and consultation related to hazardous waste management and disposal. ([Chemical Waste Disposal Guidance](#))
- Investigates accidents involving hazardous chemicals.
- Conducts exposure monitoring, as necessary.

H. Facilities Development & Operations

- Ensures that laboratories remain clean and that plumbing, HVAC, lighting and electrical circuits are functional and safe.
- Provide surveillance and inspection of laboratory safety equipment.

I. Minors

- Individuals under 18 years old are not allowed in laboratories that contain health or physical hazards unless they are registered participants in a University-sanctioned project or program.
- Individuals under 18 years old must be supervised by lab personnel at all times while working in laboratories.
- Activities involving minors, who are not enrolled or accepted for enrollment in credit-granting courses at the University (Storrs) or who are not employees of the University, must be sponsored by a unit within the University, be registered with the University’s Minor Protection Coordinator (Storrs and Farmington), and meet University policy/standards described in the Policy for the Protection of Minors and Reporting of Child Abuse and Neglect. For more information, please visit the University’s Minor Protection website and UConn Health Human Resource’s website regarding hosting an unpaid experience.
VI. Training and Information

The *OSHA Laboratory Standard* requires that training be provided to all employees working in laboratories at the time of initial assignment to a work area where hazardous chemicals are present and prior to assignments involving new exposure situations. The CHP applies this standard to all individuals working in laboratories at UConn Health. It is the responsibility of all lab personnel to attend and stay current with *Laboratory Safety & Chemical Waste Management Training* provided by EH&S and any job-specific training provided by departments, principal investigators, laboratory/facility managers, or other qualified individuals.

A. Initial Safety Training

All individuals working in labs, including principal investigators, laboratory/facility managers, lab workers, and other personnel must attend the *Initial Laboratory Safety & Chemical Waste Management Training* provided by EH&S **prior to work in laboratories**. The training covers:

- The contents and location of the *OSHA Laboratory Standard*, Hazard Communication
- The location, details and the roles and responsibilities outlined in the *Chemical Hygiene Plan*;
- The permissible exposure limits for OSHA regulated substances or recommended exposure limits;
- SDS/GHS;
- Signs and symptoms associated with exposures to hazardous chemicals;
- Proper fume hood use;
- Hazardous waste management for generators, universal waste and CT regulated waste;
- The physical and health hazards of chemicals in the work area; and
- Appropriate work practices, emergency procedures, and personal protective equipment to be used to protect individuals from hazards in laboratories;
- Proper chemical storage
- Biosafety training.

B. Refresher Training

Refresher training provided by EH&S must be completed annually by principal investigators, laboratory/facility managers, lab workers, and other individuals working in labs. The training is required to ensure that all individuals working in labs are up-to-date with current federal and state regulations and UConn Health policies regarding safety.
C. Laboratory-Specific Training

In addition to training provided by EH&S, laboratory-specific training is critical and “must be” provided by departments, principal investigators, or laboratory/facility managers on the specific hazards of chemicals, equipment, or operations unique to each laboratory. Examples of laboratory-specific training include, but are not limited to:

- Use of cryogenic liquids;
- Use/hazards of autoclaves (ex: waste deactivation versus sterilization of glassware/pressure generation);
- Pinch point hazards of machinery – guarding;
- The hazards associated with hot work/high voltage equipment; Safety protocols for use of equipment that present health and/or physical hazards to lab personnel (e.g., impact, cuts/penetration, high pressure vessels, harmful dusts/vapors, noise, etc.);
- Procedures (LSOPs) using highly reactive, extremely hazardous chemicals or reactive chemicals (e.g., peroxide formers, pyrophoric, water-reactive, etc.); and
- Emergency procedures.

Laboratory-specific training must take place prior to involvement with a hazardous chemical, a change of chemicals, equipment, or operation. Documentation of the training, including the content, training date, and signatures of both the trainee and trainer, is recommended. Please use the Workplace Hazard Assessment (WHA) found on the EH&S OVPR Website, to document this workflow. Follow the directions provided on the WHA, then submit to EH&S for review and maintain a copy for your laboratory records.

VII. Emergency and First Aid Procedures

Emergencies are incidents that pose an actual or potential threat to people and/or the environment. They include events such as, but not limited to, equipment failure, explosions, fires, spills, rupture of containers, or failure of control equipment that results in an uncontrolled release into the laboratory. The UConn Health Fire Department (UCHFD) is the first responder and must be contacted immediately after an emergency occurs. No individual working in a laboratory is allowed to use a fire extinguisher without appropriate training. All emergencies must be reported to Public Safety, (911) (emergency), the principal investigator or laboratory/facility manager and EH&S (x-2723). The following procedure must be followed if an emergency occurs:
**Table 1. Emergency Procedure**

<table>
<thead>
<tr>
<th>Course of Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. <strong>RESCUE</strong> everyone in the immediate work area to a safe location.</td>
</tr>
<tr>
<td>2. <strong>ALARM</strong> - Dial <strong>911</strong>. Follow the directions of the dispatcher. The person that dials 911 must meet the first responders upon arrival to provide further information about the emergency.</td>
</tr>
<tr>
<td>3. <strong>CLOSE</strong> - If it can be done safely, close doors to confine the area where the emergency occurred. Post a “No Entry” sign on the door(s) to prevent reentry by other personnel.</td>
</tr>
<tr>
<td>4. <strong>EVACUATE</strong> the building through the nearest exit. Do not run. Do not use elevators.</td>
</tr>
<tr>
<td>5. <strong>REPORT</strong> to your designated meeting site.</td>
</tr>
<tr>
<td>6. <strong>REENTER</strong> only after the lab has been cleared by emergency personnel.</td>
</tr>
</tbody>
</table>

Whenever an event takes place in the work area such as a spill, leak, injury, explosion or other occurrence resulting in the likelihood of a hazardous exposure, the affected employee shall be provided an opportunity for a medical consultation. Depending on the severity of exposure/incident, emergency responders shall determine if someone must be brought to the Emergency Department versus Employee Health Service/Occupational Medicine and;

- Identity the hazardous chemical(s) to which the employee may have been exposed;
- Describe the conditions under which the exposure occurred including quantitative exposure data, if available;
- Describe the signs and symptoms of exposure that the employee is experiencing, if any.

The Employee Health Service/Occupational medicine will provide to the employee for any examination/consultation required under the Laboratory Standard a written report that includes:

- Any recommendation for further medical follow-up;
- The results of the medical examination, and any associated tests;
  Any medical condition which may be revealed in the course of the examination which may place the employee at increased risk, as a result of exposure to a hazardous chemical found in the work place;
- A statement that the employee has been informed by the physician of the results of the consultation or medical examination and any medical condition that may require further examination or treatment.
A. Chemical Spills

Chemical spills refer to the uncontrolled release of chemicals, wastes, oils, or other potentially dangerous materials into the air, water, or workplace. Spills may include incidents where a person is impaired, injured, or contaminated. Chemical spills must not be cleaned up without the assistance of emergency personnel or EH&S staff (i.e., UCHFD, the local Fire Department, or other emergency response vendor). UCHFD or EH&S will assess the risk from a spill and take into account:

- Risk of fire/explosion,
- Potential overexposure to airborne contaminants,
- Onset of dangerous reactions,
- Contact hazards with corrosive and/or toxic chemicals, and
- Threat to the environment.

Lab personnel involved in hazardous chemical spills must follow the emergency Procedure outlined above in Table 1.

B. Incidental Releases

Incidental releases are small spills that can be safely dealt with by laboratory personnel. Incidental releases as defined per OSHA are incidental to the work process and less than 500 mL in volume, and which may only be cleaned up if there are no physical or health hazards to the responder.

An example of an incidental spill which may be cleaned by the laboratory personal is as follows:

Your approved protocol is to use Xylene in a 100 mL wide mouth polypropylene container. The xylene is placed in the fume hood and you are dipping a microscope slide into the chemical to remove some paraffin, and as you are doing this you accidentally knock the xylene container over and spill its contents. The contents are contained in the chemical fume hood and there are no other hazards impacting the spill-(e.g.) hot plates, reactive such as organic peroxides etc. You have no inhalation exposure as the xylene is contained in the hood. You may refer to the PPE recommendations listed on the SDS for xylene, don the appropriate gloves and absorb the spill safely. The collected material should be transferred to an appropriate waste container and compatibly stored at your S.A.A.

- Using this same example to indicate a spill scenario that would constitute an emergency, while using the same volume of <500 mL/the limit set forth by OSHA; would be if the 100 mL spilled out of the chemical fume hood and there was energized equipment...
contacted or in use which could cause a fire or explosion. This is an emergency and requires emergency protocol set forth by Public Safety directives to be initiated.

Incidental releases must present little to no risk of exposure to individuals or the environment and can be safely controlled at the time of release. If an incidental release occurs in a laboratory, contact EH&S for guidance.

C. Safety Showers and Eyewash Stations

Properly functioning eyewash stations and safety showers are required to be present for immediate emergency use within 10 seconds walking time of labs where corrosive and injurious chemicals to the eyes are used or stored. The water temperature in both eyewash stations and safety showers must range between 60°F (16°C) and 100°F (38°C). Eyewashes and safety showers must be located on the same level as the hazard and the path of travel must be free of obstructions. The ANSI standard Z358.1 should be used as a guideline for the proper design, certification, performance, installation, use, and maintenance of eyewash stations and safety showers.

Lab personnel are responsible for identifying locations of eyewash stations, safety showers, and other emergency equipment prior to initiating their research. Lab personnel must be familiar with the location and the proper operation/activation of these safety devices in the event of an emergency situation. Therefore, eyewash stations must be tested weekly by laboratory staff to ensure proper function. Safety showers are inspected annually by Facilities Development & Operations. If a safety shower has not been tested within the last year or an eyewash station or shower is not working properly, principal investigators, lab/facility managers, or other lab personnel must initiate a work order with Facilities Development & Operations to assess and/or repair the equipment.

D. First Aid Procedures

The following tables are intended as a reference only. Please refer to the chemical’s manufacturer specific SDS for specific first aid procedures.

Lab personnel are responsible for identifying locations of eyewash stations, safety showers, fire alarms, and other emergency equipment prior to research. Laboratories must maintain their emergency equipment in a safe and working condition, free of recognized hazards. The following procedure must be followed when an emergency situation results in an exposure to the eyes with a hazardous chemical.
Table 3. Eye Exposure to Hazardous Chemical

<table>
<thead>
<tr>
<th>First Aid Response</th>
</tr>

<tbody>
<tr>
<td>1. Forcibly hold both eyes open under an emergency eyewash to ensure an effective wash behind both eyelids.</td>
</tr>
<tr>
<td>2. If contact lenses are being worn, remove the contacts while flushing.</td>
</tr>
<tr>
<td>3. Dial 911 or have someone else from the lab dial 911.</td>
</tr>
<tr>
<td>4. Continue flushing the eyes underneath the eyewash until emergency personnel arrive.</td>
</tr>
<tr>
<td>5. Report the injury to your PI and/or laboratory/facility manager, EH&amp;S and Gallagher Bassett 1-800-828-2717</td>
</tr>
</tbody>
</table>

Note: Do to the nature of ocular injuries; the injured party may need assistance from a co-worker, to safely get to and deploy the emergency eyewash, and to activate the 911 response.

The following procedure must be followed when an emergency situation results in an exposure to the eyes with a nonhazardous solid.

Table 4. Eye Exposure to Nonhazardous Solid

<table>
<thead>
<tr>
<th>First Aid Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. If eyes are exposed to glass, metal, wood, or other type of particulate, do NOT flush eyes under an emergency eyewash.</td>
</tr>
<tr>
<td>2. Close or cover the eye(s), dial 911 and have emergency personnel evaluate the eye(s) prior to flushing.</td>
</tr>
<tr>
<td>3. Report the injury to your PI and/or laboratory/facility manager, EH&amp;S and Gallagher Bassett 1-800-828-2717.</td>
</tr>
</tbody>
</table>

The following procedure must be followed when an emergency situation results in a chemical exposure to the skin.
### Table 5. Skin Exposure

<table>
<thead>
<tr>
<th>First Aid Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Wash/flush affected area(s) with tepid water from a sink or an emergency safety shower. Take care not to break skin.</td>
</tr>
<tr>
<td>2. Remove or cut off contaminated clothing while rinsing. Do not pull contaminated clothing over the head.</td>
</tr>
<tr>
<td>3. For chemical and thermal burns, flush affected area(s) with water if indicated in safety data sheet.</td>
</tr>
<tr>
<td>4. For blood, biological, or radiological exposures use soap and water.</td>
</tr>
<tr>
<td>5. Dial <strong>911</strong> or have someone else from the lab dial 911.</td>
</tr>
<tr>
<td>6. Keep flushing affected area(s) until emergency personnel arrive.</td>
</tr>
<tr>
<td>7. Report the injury to your PI and/or laboratory/facility manager, EH&amp;S and Gallaher Bassett 1-800-828-2717.</td>
</tr>
</tbody>
</table>

Note: for concentrated acid & base clothing contamination, the first step is to safely try and cut away the contaminated clothing versus spreading the chemical.

The following procedure must be followed when an emergency situation results in an exposure through **inhalation of chemical vapors, fumes, or smoke**.

</tr>
</thead>
<tbody>
<tr>
<td>1. If skin comes into contact with a cryogen, place affected area in a warm water bath (not above 40°C/104°F). Never use hot or cold water or dry heat. Thawing of the affected area(s) must be done gradually.</td>
</tr>
<tr>
<td>2. If a burn from a cryogen occurs, do not rub the burned area. Rubbing can result in further tissue damage.</td>
</tr>
<tr>
<td>3. <strong>Dial 911</strong> and seek medical attention as soon as possible for all frostbite injuries.</td>
</tr>
<tr>
<td>4. Report the injury to your principal investigator and/or laboratory/facility manager, EH&amp;S and Gallagher Bassett 1-800-828-2717.</td>
</tr>
</tbody>
</table>

**VIII. Safety Documentation**

Safety documentation is required in each laboratory to assure compliance with regulations and UConn Health policies. Principal investigators or laboratory/facility managers are required to update forms and documentation as changes to laboratory personnel, chemicals, or personal protective equipment occur. The following safety documentation must be present in all laboratories:
A. Chemical Hygiene Plan (CHP)

Every laboratory is required to have an up-to-date copy of the CHP in the lab. Access to hard or electronic copies of the document is acceptable. Electronic copies must be kept on a computer that is readily accessible to all researchers. Each individual working in the lab is required to complete a CHP Signature Confirmation, confirming adherence to the CHP. In addition to the UConn Health CHP, departments, principal investigators, and/or laboratory/facility managers can develop laboratory-specific safety manuals to inform lab personnel of the hazards and procedures specific to the department or laboratory.

B. Chemical Inventory (Vertere)

The goal of the Laboratory Chemical Inventory Program is to create and maintain an accurate, campus-wide inventory of hazardous chemicals. EH&S staff maintains the chemical inventory program and will use the system to track hazardous chemicals from the point of delivery to final disposal. Principal investigators, laboratory/facility managers, and lab personnel are responsible for:

a. Following the steps for ordering chemicals and to ensure all hazardous chemicals are barcoded by EH&S prior to use;

b. Verify that the chemical ordered does not require prior EH&S approval such as with OSHA’s 13 regulated carcinogens or potential carcinogens & or highly toxic or reactive material.

d. Contacting EH&S if the barcoded materials are relocated to another location; and providing barcode numbers to EH&S (MC-1514), FAX (860-679-3826), email sasso@uchc.edu when containers are empty. The barcodes off empty or waste containers are needed in order to maintain an accurate database.
C. Safety Data Sheets (SDSs)

Safety data sheets (SDSs) are manufacturer and chemical specific. You may have printed or electronic documents that provide health and safety-related information on chemicals. Manufacturers or importers of chemicals are required to obtain or develop an SDS for each hazardous chemical they produce or import. Principal investigators or laboratory/facility managers are responsible for ensuring that SDSs are available for every hazardous chemical in the laboratory and readily accessible to lab personnel. Either printed or electronic copies of safety data sheets are acceptable. If safety data sheets will be stored on a computer, they must be on a computer that is accessible to everyone in the lab. The format of SDSs, including section numbers, headings and descriptions, are located in the table below:
<table>
<thead>
<tr>
<th>Section</th>

<td>16</td>
<td>Other information</td>
<td>Includes the date of preparation or last revision</td>
</tr>
</tbody>
</table>

Lab personnel are responsible for understanding the contents of safety data sheets to ensure proper chemical handling and use, storage, PPE and physical chemical properties. Safety data sheets can be obtained through the EH&S website, manufacturer’s websites, or other reliable sources.
D. **Workplace Hazard Assessment Form**

Every lab is required to complete a *Workplace Hazard Assessment Form (WHA).* The WHA form was designed to help supervisory personnel assess laboratory hazards & choose appropriate personal protective equipment (PPE) for their workers. A copy of the workplace hazard assessment form must be sent to EH&S and another copy must be present in the lab. The form is required to be updated whenever operations in the lab change or warrant the use of new personal protective equipment.

E. **Emergency Door Posting**

Every laboratory is required to complete and post the *Emergency Door Posting* on the exterior door of the lab. The card is used by emergency response personnel to inform them of the potential hazards within the area and provide contact information for the principal investigator and/or laboratory/facility manager if an accident occurs in the lab. The card must be updated whenever changes (addition and/or removal) to laboratory hazards occur. A copy of the card is located below:

**Note:** When laminated, use an erasable ink to maintain accurate updates.
CAUTION
AUTHORIZED PERSONNEL ONLY

</tbody>
</table>

**Laboratory PPE Requirements**

- Lab coats must be worn in this area
- Eye protection must be worn
- Wear gloves
- No open shoes
- No food or drink

**Physical Hazard Definition**
A chemical for which there is scientifically valid evidence that it is a combustible liquid, a compressed gas, explosive, flammable, an organic peroxide, an oxidizer, pyrophoric, an unstable reactive or water reactive.

**Health Hazard Definition**
Acute or chronic health effects may occur in exposed employees. The term “health hazard” includes chemicals which are carcinogenic, toxic or highly toxic agents, reproductive toxins, irritants, corrosives, sensitizers, hepatotoxins, nephrotoxins, neurotoxins, agents which act on the hematopoietic system, and agents which damage the lungs, skin, eyes, or mucous membranes.

**Other Important Hazards**

25
IX. Chemical Management

The OSHA Laboratory Standard applies to chemicals that exhibit health and physical hazards. Each type of hazardous chemical has been assigned a hazard class(s), pictogram(s) and hazard category(s) by manufacturers or importers based on scientifically validated methods, tests, and evidence. The health and/or physical hazard class(s) for each chemical is listed in the safety data sheet. Lab personnel are responsible for recognition and control of chemicals that pose health and physical hazards in their research.

Pictograms are required on original container labels and safety data sheets to alert users of the chemical hazards to which they may be exposed. Each pictogram represents a distinct hazard(s) identified by a symbol on a white background framed within a red border. The pictogram(s) is determined by chemical manufacturers and importers. Chemicals can have one or multiple pictograms.

Hazard category refers to the division of criteria within each hazard class (e.g., Flammable Liquids are divided into four hazard categories numbered from Category 1 through Category 4). These categories compare hazard severity within a specific hazard class (e.g., a Category 1 flammable liquid is considered a more severe hazard than a Category 4 based on lower flashpoints and boiling points). Most categories are classified based on a number (e.g., 1, 2, 3, etc.) and in some cases, a subcategory letter (e.g., 1A, 1B, 1C, etc.). Categories are ranked in severity by descending order (i.e., Category 1 or 1A is considered a more severe than Category 2 or 1B). Lab personnel must be familiar with the hazard category for each chemical in use to properly assess the risks involved.

A. Health Hazard Classes

The definitions, pictograms, and categories of each type of health hazard defined by OSHA are listed below: OSHA’s Hazard Classification Guidance Document provides a detailed explanation and the criteria of each category range
### Table 10. Health Hazards

<table>
<thead>
<tr>
<th>Health Hazard Class Definition</th>
<th>Pictogram(s)</th>
<th>Category Range</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Acute toxicity</strong> refers to those adverse effects occurring following oral or dermal administration of a single dose of a substance, multiple doses given within 24 hours, or an inhalation exposure of 4 hours.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1,2,3,4</td>
</tr>
<tr>
<td><strong>Aspiration</strong> means the entry of a liquid or solid chemical directly through the oral or nasal cavity, or indirectly from vomiting, into the trachea and lower respiratory system.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1</td>
</tr>
<tr>
<td><strong>Carcinogen</strong> means a substance or a mixture of substances that induce cancer or increase its incidence.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1A,1B,2</td>
</tr>
<tr>
<td><strong>Eye irritation</strong> is the production of changes in the eye following the application of test substance to the anterior surface of the eye that are fully reversible within 21 days of application.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>2A</td>
</tr>
<tr>
<td><strong>Mutation</strong> is defined as a permanent change in the amount or structure of the genetic material in a cell.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1A,1B,2</td>
</tr>
<tr>
<td><strong>Reproductive toxicity</strong> includes adverse effects on sexual function and fertility in adult males and/or females, as well as adverse effects on development of the offspring.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1A,1B,2</td>
</tr>
<tr>
<td><strong>Respiratory sensitizer</strong> means a chemical that will lead to hypersensitivity of the airways following inhalation of the chemical.</td>

<tr>
<td><strong>Skin sensitizer</strong></td>
<td>Means a chemical that will lead to an allergic response following skin contact.</td>
<td>![ Icon ]</td>
</tr>
<tr>
<td><strong>Specific target organ toxicity- single exposure (STOT-SE)</strong></td>
<td>Means specific, nonlethal target organ toxicity arising from a single exposure to a chemical.</td>
<td>![ Icon ]</td>
</tr>
<tr>
<td><strong>Specific target organ toxicity- repeated exposure (STOT-RE)</strong></td>
<td>Means specific target organ toxicity arising from repeated exposure to a substance or mixture.</td>
<td>![ Icon ]</td>
</tr>
</tbody>
</table>

B. Physical Hazard Classes

The definitions, pictograms, and categories of each type of each physical hazard defined by OSHA are listed below:

**Table 11. Physical Hazards**

<table>
<thead>
<tr>
<th>Physical Hazard Definition</th>
<th>Pictogram(s)</th>
<th>Category Range</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Chemicals that, in contact with water, emit flammable gases</em> are solid or liquid chemicals that, by interaction with water, are liable to become spontaneously flammable or to give off flammable gases in dangerous quantities.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1,2,3</td>
</tr>
<tr>
<td>A chemical that is <em>corrosive to metals</em> means a chemical which by chemical action will materially damage, or even destroy, metals.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1</td>
</tr>
<tr>
<td><em>Explosive chemicals</em> are solid or liquid chemicals that are capable of self-reaction to produce gas at such a temperature, pressure and speed as to cause damage to the surroundings.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1.1, 1.2, 1.3, 1.4, 1.5, 1.6</td>
</tr>
<tr>
<td><em>Flammable gas</em> means a gas having a flammable range with air at 20°C (68°F) and a standard pressure of 101.3 kPa (14.7 psi).</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1,2</td>
</tr>
<tr>
<td><em>Flammable liquid</em> means a liquid having a flash point of not more than 93°C (199.4°F).</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1, 2, 3, 4</td>
</tr>
<tr>
<td><em>Flammable solid</em> means a solid that is a readily combustible solid, or that may cause or contribute to fire through friction.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>1,2</td>
</tr>
<tr>
<td><em>Gases under pressure</em> are gases that are contained in a receptacle at a pressure of 200 kPa (29 psi) (gauge) or more, or that are liquefied or liquefied and refrigerated.</td>
<td><img src="image" alt="Pictogram" /></td>
<td>Compressed gases, liquefied gases, dissolved gases, refrigerated liquefied gases</td>
</tr>
</tbody>
</table>
Organic peroxide means a liquid or solid organic chemical that contains the bivalent -O-O- structure and as such is considered a derivative of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals.

Oxidizing liquid means a liquid that, while in itself is not necessarily combustible, may cause or contribute to the combustion of other material, generally by yielding oxygen.

Oxidizing solid means a solid that, while in itself is not necessarily combustible, may cause or contribute to the combustion of other material, generally by yielding oxygen.

Pyrophoric liquid means a liquid that, even in small quantities, is liable to ignite within five minutes after coming into contact with air.

Pyrophoric solid means a solid that, even in small quantities, is liable to ignite within five minutes after coming into contact with air.

Self-reactive chemicals are thermally unstable liquid or solid chemicals liable to undergo a strongly exothermic decomposition even without participation of oxygen (air).

Self-heating chemicals are a solid or liquid chemicals, other than a pyrophoric liquid or solid, which, by reaction with air and without energy supply, is liable to self-heat; this chemical differs from a pyrophoric liquid or solid in that it will ignite only when in large amounts (kilograms) and after long periods of time (hours or days).

*Table derived from OSHA 1910.1200 App B.*
C. Chemical Labeling

All chemicals and samples used or created in laboratories must be properly labeled. All new chemicals brought into labs must be labeled with a product identifier, signal word, hazard statement(s), precautionary statement(s), pictogram(s), and the name, address, and telephone number of the chemical manufacturer, importer, or other responsible party. Existing chemicals present in labs prior to December 2015, must be labeled with, at a minimum, a chemical name.

1. Original Containers

Original chemical bottles must have labels that are written in English (other languages may also be included, if necessary), legible, and prominently displayed on the container. Lab personnel are responsible for ensuring that labels on incoming containers of hazardous chemicals are not removed or defaced. Existing chemical labels that have become illegible must be relabeled to identify contents.

2. Secondary Containers

Secondary containers (e.g., beakers, flasks, jars, spray bottles, etc.) holding chemicals or samples must be properly labeled with the chemical name(s) and hazard class(s). The full name(s) of the hazard class(s) (e.g., Flammable, Corrosive, Reproductive toxicant, etc.) can be written out on the secondary container or the corresponding OSHA GHS pictogram can be affixed to the container. A list of approved OSHA GHS pictograms for both health and physical hazards is outlined below. EH&S will offer assistance in meeting this requirement and can provide GHS transfer labels upon request.

- Label all secondary containers (e.g., a beaker, flask, vial, jar, etc.) containing hazardous chemicals and samples in with the chemical name(s) and hazard class(s).

D. Chemical Segregation and Storage

Chemicals must be stored according to compatibility and hazard class. Incompatible chemicals stored in the same cabinet can react with other chemicals and degrade labels, containers, and cabinets. Lab personnel are required to review safety data sheets (SDSs) to obtain proper storage, stability, and compatibility guidelines. Incompatible chemicals must not be stored alphabetically or in close proximity of one another. At a minimum, chemicals must be segregated into the following hazard classes:

<table>
<thead>
<tr>
<th>Hazard Class</th>
<th>Recommended Storage Method</th>
<th>Common Chemical Examples</th>
<th>Common Incompatibles (Always Consult SDS)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Corrosive Acids</strong></td>
<td>Store in corrosives cabinet, or on protected shelving and in secondary containment. Secondary containment must be used when storing acids on bare metal. *Oxidizing acids must be stored in a separate, compatible secondary containment bin.</td>
<td>Hydrochloric acid, Sulfuric acid, Phosphoric acid, Nitric acid</td>
<td>Flammable liquids, flammable solids, bases and oxidizers, organic acids, cyanides, sulfides</td>
</tr>
<tr>
<td>Inorganic</td>
<td>Store in corrosives cabinet, or on protected shelving away from inorganic acids. Secondary containment must be used when storing acids on bare metal. *If stored together, organic acids must be separated from flammable chemicals using a secondary containment bin.</td>
<td>Acetic acid, Trichloroacetic acid, Formic acid</td>
<td>Flammables, bases and oxidizers, inorganic acids, cyanides, sulfides</td>
</tr>
<tr>
<td>Organic</td>
<td>Store in corrosive cabinet, and separated from acids and inorganic bases.</td>
<td>Ammonium hydroxide, Potassium hydroxide, Sodium hydroxide</td>
<td>Flammable liquids, acids, oxidizers, organic bases</td>
</tr>
<tr>
<td><strong>Corrosive Bases</strong></td>
<td>Store in corrosives cabinet, or on protected shelving away from acids.</td>
<td>Hydroxylamine, Tetramethylene diamine, Triethylamine</td>
<td>Oxidizers, hypochlorites, inorganic bases</td>
</tr>
<tr>
<td>Inorganic</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Organic</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Explosives**
Store in a secure location away from other chemicals, store in areas away from shock or friction. Store per manufacturers recommendations (temperature, no metal shelving, sunlight, etc.)

*Trinitrophenol, Picric acid, Diazoisobutylnitrile or Dry Bouin’s*

Contact EH&S immediately

---

**General Stock Chemicals**
Store on lab benches or shelves with other stock chemicals. No toxic, corrosive or compounds injurious to the eye above eye level.

*Sodium chloride, Potassium phosphate, agar*

Consult SDS and/or EH&S

---

**Flammable Liquids**
Store in an approved flammable storage cabinet.

*Peroxide-forming chemicals must be dated upon delivery, dated upon opening, and qualitatively tested/tracked per manufacturer’s recommendations.*

Ethanol, Methanol, Acetone, Xylene, Toluene, *Diethyl ether, Tetrahydrofuran*

Oxidizers, reactives, acids, bases.

Contact EH&S if you have peroxide forming chemicals.

---

**Flammable Solids**
Store in cool dry area away from oxidizers and corrosives.

*Carbon, Charcoal, Paraformaldehyde*

Acids, bases, oxidizers

---

**Oxidizers**
Store in secondary containment with non-combustibles or inorganic materials. Qualitatively tested and documented per manufacturers recommendations.

*Perchlorates, Permanganates, Nitrates*

Flammables, combustibles, organic materials

---

**Toxics**
Store in a ventilated, dry, cool area, as recommended by the manufacturer. Sodium Azide – no metal/water contact and kept secured.

*Cyanides, Heavy metal compounds (e.g., cadmium, mercury)*

Flammable liquids, acids, bases, reactives, oxidizers. Consult EH&S for assistance.

---

**Water-Reactive**
Store in a cool dry location. Protect from sources of water. Label area for water-reactive storage. (LSOPs – DOT HAZMAT Security)

*Sodium, Lithium, Potassium metals, Sodium borohydride*

Aqueous solutions, oxidizers, water sources Consult SDS for specific information.

---

**Safety data sheets must be consulted for specific manufacturer storage and compatibility guidelines.**

---

Each hazard class should be stored in a separate cabinet or location in the lab. If separate cabinets are not available, chemicals of different hazard classes, in limited cases, can be segregated by placing them on separate shelves in separate secondary containment bins within individual cabinets.
The following chemical storage requirements must be followed in laboratories:

- Flammable chemicals should be stored in an approved flammable storage cabinet, chemical storage room (if applicable) or if temperature sensitive in a properly rated/designated refrigerator.
- No storage of reagents and/or chemical waste in the fume hood.
- Minimize amounts purchased.
- Tightly seal containers to minimize the vapor release.
- Corrosive liquids and toxic to the eye chemicals must be stored below eye level (i.e., approximately 5 feet or below).
- Limited quantities of hazardous chemicals should be stored on benches, shelves or on the floors.
- If storage of hazardous chemicals on floors must occur, secondary containment is required. Secondary containment bins are recommended to retain materials if the primary container breaks or leaks.
- Acutely toxic chemicals must be stored in dedicated cabinets.
- Chemical shelving must be firmly secured to walls.
- Chemicals must not be stored on top of cabinets.
- Chemicals must be stored away from heat and direct sunlight.
- Off-specification, expired, and other chemicals with no useful purpose in the lab should be marked “hazardous waste” and placed in your S.A.A and an EH&S waste pickup request completed.

E. Chemical Transport

Chemicals will be delivered directly to laboratories by EH&S staff. When chemicals must be moved between laboratories, individuals must ensure that the following measures are taken to protect chemicals during transport.
Secondary containment must be used during transport.
The secondary containment must be large enough to contain the contents of the bottle(s) being transported in the event of breakage.
Secondary containers must be leak and break-resistant.
Ensure chemicals are tightly sealed prior to transport.
Chemicals must not be left unattended during transport.
Sturdy carts with secondary containment must be used for transporting multiple, heavy, or large containers.
Avoid transporting chemicals on stairs. Use non-patient care elevators when moving chemicals between floors.
Contact EH&S (860-679-2723) prior to transporting potentially unstable chemicals.
Wear appropriate personal protective equipment (PPE).
Avoid high-traffic areas.
Prior to moving large quantities of hazardous chemicals (e.g., relocating to another building), contact EH&S (860-679-2723) and complete the “Laboratory Clearance Form” to ensure compliance with federal, state, and local laws

Note: EH&S must be contacted when chemicals are relocated from their original assigned location to another location within or outside of the building to maintain compliance with the Vertere Chemical Inventory System.

Note: The use of a personal vehicle and/or the shuttle service to transport animals, chemicals and/or infectious biological agents is forbidden.

Note: Shipping of chemicals requires additional training and documentation. Please contact EH&S.

X. Standard Operating Procedures

All individuals working in UConn Health laboratories must follow the standard lab procedures listed in the Chemical Hygiene Plan. Additional lab-specific policies or work practices required by the PI or Laboratory/Facility Manager must also be followed by lab personnel. Lab-specific policies and practices must be at least as stringent as the guidelines in the CHP.
A. General Requirements

- Avoid working alone in laboratories. Review the Working Alone Policy to understand responsibilities and disciplinary actions for violation of the policy.
- Unauthorized individuals are not allowed in laboratories. Access is limited to UConn Health lab personnel and visitors with legitimate reasons for being in such a laboratory. Authorized individuals must be properly trained, made aware of the hazards present in the lab, and provided appropriate personal protective equipment. Non-research related individuals (visitors, vendors, IT, etc.) must be accompanied at all times by an experienced laboratory staff member.
- Pets are not allowed in laboratories, with limited exceptions for police dogs and service animals (e.g., guide dogs). The only live vertebrate animals allowed in laboratories are those to be used in teaching and research and must be approved prior to entry by the Institutional Animal Care and Use Committee (IACUC).
- Review the safety data sheet(s) for all applicable chemicals prior to use.
- Substitute a hazardous chemical with a safer alternate, or reduce the quantities of hazardous chemicals being used whenever possible.
- Review the CHP and laboratory-specific standard operating procedures.
- Identify and understand how to properly use emergency equipment. No individual working in a laboratory is allowed to use a fire extinguisher without training through UCHFD.
- Know procedures for emergencies, including evacuation routes.
- Wear personal protective equipment (PPE) as specified in the Workplace Hazard Assessment Form (maintain a copy of your completed WHA in laboratory safety binder), safety data sheets, or equipment specifications.
- At a minimum, ANSI-approved safety glasses or goggles (when there is a potential for a splash and/or impact hazard), clothing that covers the legs, and closed-toed footwear (e.g., no sandals, flip-flops, etc.) must be worn at all times in active lab areas. Corrective eyeglasses must be used in conjunction with safety eyewear unless the eyeglasses comply with ANSI standard Z87.1.
- Inspect equipment and personal protective equipment (PPE) for damage prior to use. Replace or repair damaged equipment or PPE.
- Use a properly functioning chemical fume hood or other local ventilation when working with hazardous chemicals.
- Use all chemicals and equipment for their intended purpose.
- Use spill trays under equipment to catch accidental spills or overflow of liquids.
- Report accidents, spills, or other emergencies to Public Safety, the principal investigator or laboratory/facility manager and EH&S.
B. Personal Hygiene

- Do not eat, drink, smoke, chew gum, or apply cosmetics in active lab areas.
- Do not store food, beverages, tobacco, or cosmetic products in active lab areas.
- Never touch a hazardous chemical without appropriate hand protection.
- Never attempt to smell, inhale, or taste a hazardous chemical.
- Do not reuse disposable gloves.
- Do not use mouth suction to pipet. Use a pipet bulb or similar device.
- Secure loose-fitting jewelry.
- Tie back and secure long hair.
- Lab coats are recommended for all research involving hazardous chemicals. Specific required lab attire must be documented in the WHA form. Again must have correct WHA linked
  - PPE is task specific and based on the primary hazard. Please refer to SDS for manufacturer PPE recommendations.
- Contaminated PPE is not allowed in any public areas.
- Wash hands thoroughly with soap and water before and after handling chemicals, and prior to exiting the lab.
- Wash affected areas promptly whenever a chemical has come in contact with the skin.
- Remove and properly manage contaminated clothing and gloves before leaving the laboratory.
- Contaminated clothing and other reusable personal protective equipment must be laundered by an approved vendor. Contaminated clothing must never be taken home for cleaning.
- All contaminated materials and equipment must be decontaminated prior to reuse or disposal.

C. Housekeeping

- Fire alarms, fire extinguishers, electrical panels, disconnect switches, first-aid kits, safety showers, eyewash stations, and other safety-related equipment must remain unobstructed and be appropriately marked.
- Aisles, hallways, and stairs must be kept clear of chemicals and equipment.
- Lab benches, floors, shelving, and equipment must be kept clean and orderly and in a sanitary condition.
- Lab benches must be cleared of additional chemicals, materials, and equipment that are not necessary to perform current research.
- Lab benches and equipment must be cleaned and/or decontaminated at the end of
each experiment and each work day. (Unknown powders on a benchtop post experiment is not acceptable)

- Laboratory doors must be kept closed to minimize the spread of chemical vapors, pathogens, or smoke in case of an accident.
- Materials, including chemicals, wastes, equipment, cords, and other objects, must be stored in a manner that does not create a hazard for workers.
- Storage of flammable/combustible materials (e.g., rags, paper, cardboard, etc.) must be limited.
- Order only chemicals in amounts that will be used in the foreseeable future. Excessive storage increases the potential for chemical exposure/accidents and increased hazardous waste disposal costs.
- Lab equipment must be regularly inspected and maintained, and repaired whenever necessary. (Critical for CTDPH, CLIA and CAP accreditation)
- Floors must remain clean and dry.
- Floors must be free of obstructions that could pose a slip, trip, or fall hazard.
- Vacuum equipment must be trapped or filtered.
- Chemicals must be placed in assigned storage areas at the end of each day.
- Spills must be reported immediately to Public Safety (911) or EH&S (x2723)
- All belts, pulleys, fans, and other moving parts must be appropriately guarded.
- Space heaters are not allowed in laboratories.
- Hazardous waste must be labeled and managed properly per training, SAA signage and waste management posters provided.
- Sharps must be disposed of in an OSHA approved sharps container.
- Biomedical sharps may not be disposed of into a glass trash box.

D. Electrical Safety

1. Electrical Panels
   - Disconnect switches or panic buttons must remain unobstructed.
   - A minimum 3-foot clearance must be maintained in front of electrical panels at all times to permit ready and safe operation and maintenance of such equipment.
   - Electrical boxes with conductors, receptacles, and switches, etc., must have covers in place and show no signs of damage.

2. Electrical Cords
   - Electrical cords must not be frayed, twisted, worn, abraded, corroded, or used with exposed wires or missing groundpins.
- Electrical cords must be sized in accordance with the load that the cord will carry and the environment they are exposed to.
- Extension cords are only to be used on a temporary basis.
- Extension cords must not be used as a substitution for fixed receptacle outlets.
- Multi-tap power strips are only allowed for use with computer or electronic equipment that normally does not draw excessive amperage per the ratings on the unit.
- Extension cords and/or power strips must never be linked together (i.e., daisy-chaining).
- Electrical cords must not run through doors, walls or partitions, under rugs, or above drop ceilings. They must not be tied in knots, draped overhead, or attached to building structures.
- Electrical cords should be grounded (do not remove ground prongs).
- Electrical circuits must never be overloaded.

3. **Electrical Equipment**

- Electrical equipment must be kept away from wet or damp locations, unless specifically rated for use under such conditions.
- Live parts must be effectively insulated or physically guarded.
- Enclose all power supplies to prevent contact with power circuits.
- Use a ground fault circuit interrupter when using electrical devices in, or in close proximity to, wet environments. In some cases, it may be necessary to install ground fault circuit interrupting devices in the circuits being utilized.
- Keep flammable and corrosive materials away from electrical equipment, unless the equipment is rated for such environments by the manufacturer.
- Repairs and maintenance of electrical equipment must be conducted by a Qualified/Licensed individual.

E. **Research Approval/EH&S Approval**

Laboratory personnel must obtain approval from their principal investigator prior to:

- Working alone in an immediately hazardous environment.
- Performing new or unfamiliar procedures.
- A change in quantity and/or volume or substitution of the chemicals in the procedure is planned. Principal investigators must determine the quantity/volume for which further approval is required.
- A change in the agreed-upon experimental set-up is planned.
- Signs of a failure in safety design or equipment are observed.
- **Signs or symptoms** of a chemical exposure are observed.
- Unexpected and/or potentially dangerous experimental results occur (e.g., fire, uncontrolled buildup of heat and/or pressure, etc.).

Prior EH&S approval required
- Using highly reactive or toxic chemicals (e.g., pyrophoric chemicals, hydrofluoric acid, poison gas, etc.).
- Performing highly hazardous procedures (e.g., potential for violent reaction, generation of a toxic gas, etc.).
- OSHA 13 Carcinogens

The principal investigator and EH&S are available to assist laboratory personnel in reviewing hazards associated with any procedure, equipment, or chemical to be used in the laboratory to ensure that appropriate safety procedures and safeguards are established.

**F. Laboratory Inspections**

EH&S conducts laboratory safety inspections to ensure compliance with federal and state laws and regulations, along with UConn Health policies and standards. Priority will be given to laboratories using highly reactive, toxic, or potentially explosive substances.

Standards to achieve laboratory compliance are detailed within this plan. The EH&S inspection procedure is outlined below:

1. EH&S will attempt to contact the principal investigator or laboratory/facility manager of each laboratory in advance of the inspection.

2. EH&S will inspect the laboratory.

3. A copy of the inspection report will be sent to the principal investigator and/or laboratory/facility manager within 7 business days. Documentation and tracking of all inspections are maintained on EH&S’ master system called HuskySMS/BioRaft. Deficiencies, including lapses in training, will appear on the lab’s dashboard.

4. The principal investigator and/or laboratory/facility manager must take corrective action and respond to EH&S within 21 days of receipt of the inspection report.

5. Laboratories identified with unsafe conditions will be re-inspected by EH&S. Re-inspections may be either announced or unannounced. If progress is unsatisfactory, a second inspection report will be sent to the principal investigator and/or laboratory/facility manager.
manager and the department head.

In addition to EH&S inspections, self-inspections should be carried out regularly by laboratory personnel to confirm compliance and identify safety related issues.

G. Laboratory Security

Lab personnel must take measures to ensure labs remain secure to prevent theft, sabotage, or vandalism. The following measures must be taken to ensure labs remain secure:

- Keep laboratory doors closed at all times and locked when unoccupied.
- Ensure doors to cold rooms, dark rooms, common areas, and storage rooms with hazardous chemicals remain locked when unoccupied.
- Provide additional security, such as a locked cabinet, for highly toxic or reactive chemicals.
- Dispose of hazardous chemicals no longer being used through EH&S.
- Do not allow unauthorized individuals to enter labs.
- Report thefts, vandalism or other suspicious activities to UCPD immediately.

In addition to the general precautions listed above, applicable labs must also comply with the specific security requirements involving toxins, radioactive isotopes, research animals, and controlled substances.

H. Exposure Monitoring

Personal and/or environmental exposure monitoring may be necessary when lab personnel exhibit signs or symptoms of a chemical exposure or perform experiments using hazardous chemicals without adequate ventilation. Principal investigators, laboratory/facility managers, and laboratory personnel are responsible for contacting EH&S when laboratory activities have or could lead to an actual or potential overexposure. In such cases, EH&S will perform an exposure assessment and may conduct specific quantitative exposure monitoring. Monitoring results will be sent to the PI and all affected individuals. The results of the monitoring will be kept on file at EH&S.

XI. Controlling Workplace Hazards

Efforts must be made to control hazardous or potentially hazardous conditions in laboratories. The hierarchy of controls is a system that lists hazard controls in descending order from the most effective to the least. The hierarchy of controls is listed below:
Procedures must be followed in laboratories to both control the hazard and control worker exposure to the hazard. The primary methods for controlling exposure to hazards in the workplace must be through elimination, substitution with less toxic materials, or through engineering controls such as ventilation or enclosure of an operation. If such controls are not feasible or cannot alone reduce exposures to acceptable levels, appropriate administrative controls and/or personal protective equipment must be used, preferably in conjunction with engineering controls, to minimize worker exposure to hazards.

A. Engineering Controls

Engineering controls seek to control hazards at their source by designing the work environment or the job itself to eliminate or reduce exposure to hazards. Examples of engineering controls include:

- Purchasing equipment that provides a barrier between the hazard(s) and the individual(s);
- Redesigning existing equipment to reduce hazards;
- Change of a process to minimize contaminant release;
- Use of barriers, shields, or enclosures to isolate a hazard or a person; and
- Use of local exhaust ventilation.

1. **Fume Hoods**

Fume hoods are the most important engineering control used in labs to protect workers from exposure to hazardous chemicals. All procedures or operations that generate irritating and/or hazardous air contaminants should be conducted inside a fume hood. EH&S annually inspects all constant velocity and variable air volume (VAV) fume hoods to ensure proper flow rates. The average face velocity deemed acceptable by UConn Health is 80 to 120 linear feet per minute. A sticker will be applied to all hoods tested indicating testing results or indicating the hood did not meet minimum performance standards.

EH&S initiates work orders through Facilities Development & Operations for all fume hoods that receive “Hood Failed” stickers. Facilities Development & Operations will contact EH&S to recheck the hoods once repairs have been completed. Lab personnel must not use underperforming fume hoods until EH&S re-inspects and assures proper function.

The following work practices, at a minimum, must be followed while working in fume hoods:
### Table 15. Fume Hood Work Practices

<table>
<thead>
<tr>
<th>Work Practices</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Keep all apparatus and chemicals at least <strong>6 inches</strong> back from the front face of the hood.</td>
</tr>
<tr>
<td>2. Do not store chemicals or chemical waste apparatus in the hood.</td>
</tr>
<tr>
<td>3. Keep the hood sash lowered as much as possible. <strong>Never exceed 18 inches</strong>. For hoods equipped</td>
</tr>
<tr>
<td>with horizontal sash panels that continue to have the ability to slide/move a panel please contact</td>
</tr>
<tr>
<td>EH&amp;S.</td>
</tr>
<tr>
<td>4. Do not use the hood to volatilize chemicals or wastes (i.e., allow chemicals to evaporate).</td>
</tr>
<tr>
<td>Store chemical waste in S.A.A. (satellite accumulation area) not in.</td>
</tr>
<tr>
<td>5. Keep the slots in the hood baffles free of obstruction.</td>
</tr>
<tr>
<td>6. Never use electrical outlets inside the hood. Run all equipment cords to outlets outside of</td>
</tr>
<tr>
<td>the hood.</td>
</tr>
<tr>
<td>7. Elevate large equipment (e.g., a centrifuge) at least two inches off the base of the hood</td>
</tr>
<tr>
<td>interior to allow proper airflow.</td>
</tr>
<tr>
<td>8. Fume hoods must remain working at all times when chemicals are present in the hood.</td>
</tr>
<tr>
<td>9. Keep the hood sash closed when not in use. (energy conservation)</td>
</tr>
<tr>
<td>10. Lab personnel must be aware of the lab-specific procedures to follow in the event of a fume</td>
</tr>
<tr>
<td>hood failure.</td>
</tr>
<tr>
<td>11. Never work in a fume hood that is in alarm or not running properly. Remove chemicals from</td>
</tr>
<tr>
<td>hood, close the sash, and contact EH&amp;S (860-679-2723) to retest the hood or contact Facilities</td>
</tr>
<tr>
<td>Development &amp; Operations (x-2125) to file a service request.</td>
</tr>
</tbody>
</table>

**Caution:** Using perchloric acid in a standard fume hood can lead to accumulation of explosive perchlorate salts in the ductwork. Heating or concentrating perchloric acid in a chemical fume hood is forbidden. Contact EH&S x-2723

### 2. Gloveboxes

Gloveboxes are enclosed compartments with tight-closing doors or air locks and armholes with impervious gloves sealed into the box. They can be under either positive or negative pressure and are designed to provide a separate atmosphere for hazardous materials that are sensitive to air, water vapor, or other air contaminants. Depending on the material in use, exposure to air contaminants can lead to rapid degradation or a violent reaction. The following work practices must be followed while working in gloveboxes:
• The principal investigator or laboratory/facility manager must ensure that all personnel are trained prior to working in the glovebox. Training should be documented.

• The principal investigator or laboratory/facility manager is responsible for ensuring the glovebox, vacuum pump and associated cords, lines, gauges, solvent scrubbers, and/or other associated equipment have been installed and are used as specified by the manufacturer.

• Inspect the gloves, windows, vacuum pump, lines, and connections for signs of damage or deterioration (e.g., holes, discoloration, etc.) prior to each use.

• Maintain the glovebox as specified by the manufacturer, including routine maintenance and service contracts.

• Wear nitrile gloves inside the glovebox gloves to extend the life of the glovebox gloves and avoid cross-contamination.

• Ensure back-up procedures are in place for a loss of power or an absence of required compressed gases.

3. Other Sources of Ventilation

In addition to fume hoods and gloveboxes, other forms of ventilation including biosafety cabinets, canopy hoods, clean benches, downdraft tables, ductless fume hoods, elephant trunks, slot hoods and other devices may be present in labs. Local exhaust ventilation (LEV) refers to systems designed to enclose or capture and remove contaminated air at the source. Other sources of ventilation are only designed to protect samples or products from contamination. Types and descriptions of other sources of ventilation are indicated in the table below:
<table>
<thead>
<tr>
<th>Table 16. Additional Ventilated Devices in Laboratories</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>Biosafety Cabinets</td>
</tr>
<tr>
<td>Canopy Hoods</td>
</tr>
<tr>
<td>Clean Benches</td>
</tr>
<tr>
<td>Downdraft Tables</td>
</tr>
<tr>
<td>Ductless Fume Hoods</td>
</tr>
<tr>
<td>Elephant Trunks</td>
</tr>
<tr>
<td>Slot Hoods</td>
</tr>
</tbody>
</table>
The following guidelines must be adhered to while working with biosafety cabinets, canopy hoods, clean benches, downdraft tables, ductless fume hoods, elephant trunks, slot hoods, toxic gas cabinets, and other sources of ventilation.

- The department, principal investigator, and/or laboratory/facility manager is/are responsible for ensuring that the local exhaust and/or other ventilated devices have been installed as specified by the manufacturer.
- All lab personnel working with the ventilated device must have appropriate training. Training should be documented.
- Inspect the equipment prior to each use.
- Maintain the equipment as indicated by the manufacturer, including routine maintenance and service contracts.
- Wear appropriate personal protective equipment as indicated in the workplace hazard assessment form, safety data sheets, and/or manufacturer equipment specifications.
- Ensure proper backup measures are in place for a loss of power or other equipment failure.

B. Administrative Controls

Administrative controls are policies, work practices, and procedures designed to limit personnel exposure to workplace hazards. Administrative controls are often used in conjunction with engineering controls and personal protective equipment. Examples of administrative controls include:

- Training and education;
- Policies to limit risk of exposure;
- Standard operating procedures;
- Housekeeping;
- Routine maintenance of equipment; and
- Signs and labels.

In addition to the guidelines in the Chemical Hygiene Plan, the principal investigator and/or laboratory/facility manager may implement administrative controls specific to their labs. Lab-specific training and other lab-specific policies and procedures must be provided to lab personnel and documented.
1. Working Alone in Labs

The **Working Alone Policy** applies to undergraduates, graduate students, and post-doctoral scholars performing academic or research related work. The policy was developed to minimize the risk of serious injury while working alone with materials, equipment, or in areas that could result in serious injury or an immediate life-threatening hazard. Department heads, principal investigators, laboratory/facility managers, lab workers, and others responsible for assigning work to students must not permit them to work alone in an immediately hazardous environment, as defined in the policy.

2. Lab-Specific Standard Operating Procedures (LSOPs)

Lab-specific standard operating procedures (LSOPs) are detailed documents that describe the steps and appropriate safety controls that must be followed prior to performing a given experimental procedure. While the *Chemical Hygiene Plan* provides a general overview of safe work practices with regards to laboratory safety, principal investigators, laboratory/facility managers, and other lab personnel are responsible for developing LSOPs for procedures involving extremely hazardous/toxic/reactive chemicals and/or processes that fall outside the guidelines of the CHP. LSOPs must provide enough detail so that individuals with limited experience can safely carry out the procedure or process. Specific attention must be paid to chemicals with high degrees of acute toxicity, reactivity (e.g., explosives, pyrophorics, etc.) and other chemicals which can cause severe harm upon single or repeated exposure. Each LSOP must include, at a minimum, the following elements:

<table>
<thead>
<tr>
<th>Section</th>
<th>Section Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Chemical or List of Chemicals</td>
</tr>
<tr>
<td>2.</td>
<td>Administrative Controls</td>
</tr>
<tr>

<td>10.</td>
<td>Decontamination Procedures</td>
</tr>
<tr>
<td>11.</td>
<td>Specific Protocols</td>
</tr>
<tr>
<td>12.</td>
<td>Approval</td>
</tr>
</tbody>
</table>
For your convenience, EH&S has developed numerous LSOPs concerning that are regarded as a higher hazard level and/or reactive (e.g.’s. hydrofluoric acid (HF) and pyrophoric chemicals). Principal investigators whose labs use HF, pyrophoric chemicals or acutely toxic and/or highly reactive chemicals are responsible for completing the LSOP, signing a copy, ensuring that lab personnel review and sign the LSOP, and modifying the LSOP if procedures change. Every individual working with these chemicals are required to review, follow, and sign a copy of the LSOP. All LSOPs must be readily available in the lab.

**Note:** Principal investigators or laboratory/facility managers must develop lab- specific procedures for other chemicals, processes, or operations not covered by the standard operating procedures in the CHP. A blank LSOP template is available for this purpose. LSOPs developed without using this template, must include all the elements noted in the template.

C. **Personal Protective Equipment**

When engineering or administrative controls are not feasible or do not provide sufficient protection from hazards, principal investigators and/or laboratory/facility managers are responsible for providing appropriate personal protective equipment (PPE) to lab personnel and ensuring its proper maintenance and use. PPE for the eyes, face, hands, head, body, and feet must be of safe design and construction for the work to be performed and be used and maintained in a sanitary and reliable condition. A [Workplace Hazard Assessment](#) must be performed to determine the appropriate PPE to be worn in each lab or for specific work activities.

Personal protective equipment must provide a level of protection **greater than the minimum** required to protect individuals from the hazards identified in the lab. Careful consideration must be given to fit and comfort. PPE that fits poorly will not provide adequate protection. PPE that fits well and is comfortable to wear will encourage further use. Multiple sizes and/or types of PPE may need to be purchased to accommodate all lab personnel. If several different types of PPE are worn together, they must be compatible.

PPE must conform to the **American National Standards Institute (ANSI)/International Safety Equipment Association (ISEA)** or **American Society for Testing and Materials (ASTM)** requirements that have been incorporated into the OSHA regulations, as follows:
Table 18. Personal Protective Equipment Standards

<table>
<thead>
<tr>

<tr>
<td></td>
<td></td>
<td></td>
<td>• Lab coats</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Aprons, vests or sleeves</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Heat-resistant clothing</td>
</tr>
</tbody>
</table>

The minimum personal protective equipment that must be worn in labs where hazardous chemicals are used or stored are ANSI-approved goggles or safety glasses, clothing that covers the legs, and closed-toed footwear (i.e., sandals, flip-flops, clogs, or other footwear that expose the front, top, side or back of the feet are not allowed). Lab coats are required for all work involving hazardous chemicals. Chemical splash goggles are required when handling:

- Chemicals known to cause damage or injury to the eyes;
- Chemicals whose ability to cause damage or injury to the eyes is unknown;
- Liquids over 60°C (140°F); and
- Cryogenic liquids.

Principal investigators or laboratory/facility managers must determine, through the Workplace Hazard Assessment, when face shields that protect the chin, neck, and ears must
be worn by lab personnel (e.g., increased risk of splashing, flying particles, etc.). Face shields must be used in conjunction with safety goggles or glasses. Additional PPE, as indicated on the lab Workplace Hazard Assessment Form, must also be worn by lab personnel.

1. **Glove Selection**

Prior to engaging in work with hazardous chemicals, principal investigators, laboratory/facility managers, and lab personnel must ensure that the gloves being worn are compatible with the substances being handled. The hazards of the chemical, duration of use, temperature, pH, and other properties of the chemical as well as the permeation rate, breakthrough time, and degradation rate of the glove must all be taken into account. No single type of glove will provide adequate protection against all chemicals. **Safety data sheets (SDSs) and the manufacturer's chemical-resistance glove guide must be consulted to ensure proper selection.**

Laboratory personnel may consult with EH&S for assistance in determining which gloves provide the best protection against specific hazards. The following glove guide gives a general overview of the most common types of chemical-resistant gloves and the types of hazards they can guard against:

<table>
<thead>
<tr>
<th>Type</th>
<th>Advantages</th>
<th>Disadvantages</th>
<th>Use Against</th>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Good for most hazardous chemicals</td>
<td></td>
</tr>
</tbody>
</table>

2. **Respirators**

The primary method for controlling exposure to respiratory hazards in the workplace must be through engineering controls such as ventilation, enclosure of an operation, or substitution with less toxic materials. However, when lab personnel have the potential to be exposed above recognized exposure limits. Should you be required to wear respiratory protection, you must contact EH&S to be evaluated, medical clearance and respiratory selection. Rationale for respiratory protection, examples below:

- Engineering controls are not feasible;
- Engineering controls alone cannot reduce exposures to acceptable levels; or
- Respirators are used as an interim measure while engineering controls are in the process of being implemented.

Principal investigators, laboratory/facility managers, and lab personnel planning to wear respirators must comply with all requirements outlined in the [UConn Health Respirator Program](#).

a. **Required Use of Respirators**

Lab personnel required to use respirators, including filtering facepiece respirators (e.g., dust masks), must be trained in their proper use, inspection, and maintenance, and must receive a medical evaluation and fit test prior to use. The principal investigator and/or laboratory/facility manager must ensure that lab personnel
receive training through EH&S as follows:

1) Initially - prior to being assigned a respirator;
2) Annually; and
3) Whenever retraining appears necessary because:

   a) Changes in the workplace or the type of respirator render the previous training obsolete.
   b) Inadequacies in an individual’s knowledge or use of the respirator indicate that the individual has not retained the necessary understanding or skill.
   c) Any other situation arises in which retraining appears necessary to ensure safe respirator use.

b. Voluntary Use of Dust/Particulate Masks

On occasion individuals may desire to use dust masks voluntarily in labs, though conditions do not exist that mandate their use. In such cases, medical evaluations and fit testing are not required and the employer may provide dust masks at the request of the individual or permit them to use their own if:

1) The use of the dust mask is not required by the principal investigator and/or laboratory/facility manager;
2) The dust mask is used for comfort purposes only and not to protect the health of the worker;
3) The principal investigator and/or laboratory/facility manager determines that such dust mask use will not in itself create a hazard; and
4) Selection, maintenance, and training requirements are met.

EH&S is available to assist with the selection of respirators and training of staff.
XII. Waste Management

A. Hazardous Waste

Hazardous wastes include discarded solids, liquids, or gases with properties that are dangerous or potentially harmful to human health or the environment. Hazardous wastes include those chemicals that are listed as a hazardous waste or exhibit characteristics (i.e., ignitability, corrosivity, reactivity, or toxicity) of a hazardous waste as defined by the Environmental Protection Agency (EPA). All listed and characteristic hazardous wastes are identified by waste codes. The waste list and descriptions of each type are listed in the table below:

<table>
<thead>
<tr>
<th>Hazardous Waste List</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-list (Non-specific source wastes)</td>
<td>The F-list consists of 28 different wastes, including certain spent solvents, metal finishing wastes, dioxin-containing wastes, chemical manufacturing wastes, wood preserving wastes, petroleum refinery wastewater treatment sludge’s, and hazardous waste landfill leachate.</td>
</tr>
<tr>
<td>K-list (Source-specific wastes)</td>
<td>The K-list consists of over 100 wastes from specific industrial processes (e.g., wood preserving, petroleum refining, primary and secondary metals manufacturing; and the manufacturing of industrial chemicals, inks, pigments, pesticides, explosives, and veterinary pharmaceuticals).</td>
</tr>
<tr>
<td>P-list (Discarded commercial chemical products- acute)</td>
<td>This P-list consists of about 200 different commercial chemical products that are defined as acutely hazardous and toxic. Wastes that fall under this listing include only those products that contain the listed constituent as the sole active ingredient. These wastes include virgin materials that are being discarded, as well as container residues and spill residues.</td>
</tr>
<tr>
<td>U-list (Discarded commercial chemical products- non- acute)</td>
<td>The U-list consists of several hundred different commercial chemical products. Wastes that fall under this listing include only those products that contain the listed constituent as the sole active ingredient. These wastes include old or off- specification virgin materials that are being discarded, as well as container residues and spill residues of these materials.</td>
</tr>
</tbody>
</table>

*Table derived from 40 CFR Part 261 Subpart D.*
Hazardous wastes not identified on the F, K, P or U-lists must still be managed in labs as hazardous waste if they exhibit any of the four characteristics listed below:

### Table 21. Characteristics of Hazardous Wastes

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ignitability</strong> (D001)</td>
<td>A waste is <strong>ignitable</strong> if: (1) it is liquid and has a flash point below 140°F Fahrenheit; (2) it is a flammable solid; (3) it is an ignitable compressed gas; or (4) it is classified by the U.S. Department of Transportation as an oxidizer. Alcohol with &gt; 24% by content.</td>
</tr>
<tr>
<td><strong>Corrosivity</strong> (D002)</td>
<td>A waste is <strong>corrosive</strong> if: (1) it is aqueous (i.e., water-based) and has a pH of 2.0 or lower (i.e., a strong acid) or 12.5 or more (i.e., a strong alkali/base); or (2) it can corrode steel at a rate of greater than 0.250 inch per year.</td>
</tr>
<tr>
<td><strong>Reactivity</strong> (D003)</td>
<td><strong>Reactive wastes</strong> include wastes that are unstable, react with water or form hazardous mixtures with water, are capable of releasing toxic cyanide or sulfide gases under certain conditions, are explosive, or are capable of detonating under normal conditions or when heated.</td>
</tr>
<tr>
<td><strong>Toxicity</strong> (D004-D043)</td>
<td>A waste is <strong>toxic</strong> if it contains any of 40 different hazardous constituents at a concentration equal to or greater than a certain threshold amount. These 40 constituents include 8 metals, 6 pesticides, 2 herbicides, 10 volatile organic compounds (VOCs), and 14 semi-volatile organic compounds (SVOCs).</td>
</tr>
</tbody>
</table>

Table derived from 40 CFR Part 261 Subpart C.

No listed (i.e., F, K, P, or U-listed wastes) or characteristic hazardous wastes are allowed to be disposed of down drains, treated to render them non-hazardous, or volatilized into the air. In addition, abandoned chemicals, unknown chemicals or chemicals in deteriorating containers must also be managed as hazardous waste. The principal investigator and/or laboratory/facility manager is responsible for assuring that the procedures outlined in the [UConn Health Chemical Waste Disposal Guidance](#) are followed by their lab workers.

### 1. Hazardous Waste Management in the Laboratory

- **a.** Package all hazardous waste in a sturdy container compatible with the type of waste to be stored in it. Empty household or food grade containers must not be used to store hazardous waste.

- **b.** All waste containers must be marked with the words “Hazardous Waste” and full chemical names (i.e., **DO NOT USE CHEMICAL FORMULAS OR ABBREVIATIONS**) from the moment waste is added. EH&S provides “Hazardous Waste” stickers and/or tags upon request. Examples of compliant hazardous waste labels are pictured below:

- **c.** Containers must remain closed with a tight-fitting cap or lid (e.g., no corks, rubber
stoppers, open funnels or parafilm), unless waste is being directly added to the container.

d. Containers that continually generate hazardous wastes (e.g., HPLC wastes) must be placed in secondary containment, and all tubes and hoses must be closed as much as possible to minimize potential release.

e. Incompatible materials must not be mixed in the same container.

f. Incompatible materials must not be stored in the same secondary containment bin.

g. All hazardous waste must be stored at or near a “Satellite Accumulation Area” (SAA) sign (below). EH&S provides laminated SAA signs upon request.

h. SAA areas must not exceed 55 gallons of non-acute waste per waste stream or 1 quart or 2.2 lbs. of acutely hazardous waste. One drop over these limits require an accumulation start date and the removal of the material within 72 hours by EH&S.

2. Hazardous Waste Disposal Procedures

a. Ensure “Hazardous Waste” tags or stickers, full chemical names, and percentages are legible and prominently displayed on each container.

b. EH&S will NOT remove hazardous wastes that have chemical abbreviations or symbols, illegible names, or fail to use “Hazardous Waste” stickers or tags.

c. When waste containers are almost full, a Chemical Waste Pickup Request Form must be submitted. The form is also available on the EH&S website.
B. Ethidium Bromide Waste

Ethidium bromide is a toxin capable of causing harm and genetic defects upon exposure. Although ethidium bromide is not regulated by the EPA as a hazardous waste, specific work practices must be followed to ensure proper disposal through EH&S. The management and disposal practices for ethidium bromide waste are listed below:

**Table 22. Management of Ethidium Bromide Solids & Liquids**

<table>
<thead>
<tr>
<th>Ethidium Bromide Solid Waste Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Place ethidium bromide gels in a plastic container and place into biohazard incineration cardboard box available from Facilities Development &amp; Operations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Ethidium Bromide Liquid Waste Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Place ethidium bromide liquids in a sturdy, non-leaking container.</td>
</tr>
<tr>
<td>2. Place a green “Connecticut Regulated Waste” sticker (supplied by EH&amp;S) on the container and label the sticker “Ethidium Bromide.”</td>
</tr>
<tr>
<td>3. Submit an EH&amp;S <a href="#">Chemical Waste Pickup Request Form</a> when the container is almost full.</td>
</tr>
<tr>
<td>4. EH&amp;S will remove the waste during the next regularly scheduled pick-up.</td>
</tr>
</tbody>
</table>

C. Universal Waste Management & Disposal

Universal wastes refer to common items such as thermometers, batteries, and fluorescent lamps that contain mercury and/or other toxic metals. These wastes are generated in a wide variety of settings, including laboratories. The [Universal Waste Procedures](#) are a collaborative effort between EH&S (mercury containing devices, batteries, used oil, pesticides), Facilities Development & Operations (Fluorescent lamps) and Logistics Management (used electronics).

D. Other Waste Management

In addition to hazardous chemical wastes, other materials generated in labs must also be properly managed. Lab personnel are required to follow all applicable policies and procedures that pertain to the waste generated in your lab. Example of additional policies are as follows:
Empty chemical containers that are not acutely hazardous must be managed based on the chemical(s) originally present in the container and be removed from the chemical inventory program (Vertere). Note: No pourable chemicals should be left in the empty container and you must deface the original label before discarding into trash.

a. Acutely Hazardous Chemicals

Empty containers of \textit{P-listed} chemicals must be properly labeled as hazardous waste and be discarded through EH&S. Wastes that fall on the P-List include only those products that contain the listed constituent as the sole active ingredient. \textit{P-listed} chemicals commonly found in labs include osmium tetroxide, sodium azide, potassium cyanide, 2,4-dinitrophenol, and arsenic trioxide. Prior to disposal of any empty container, principal investigators, laboratory/facility managers, and lab personnel must determine if the empty container is listed on the EPA’s \textit{P-List}.

b. Non-Acutely Hazardous Chemicals

All empty containers, \textbf{not identified on the P-List}, must meet the following criteria prior to disposal in the regular trash:

- All waste has been removed using the practices commonly employed to remove materials from that type of container, e.g., pouring, pumping, and aspirating;
- The empty container does not have a residual, highly noxious odor.

If the above criteria is met, the caps on the empty containers must be removed and the chemical name(s) must be crossed out/defaced before the containers can be disposed of in the regular trash, lab glass, or other suitable waste receptacle.
If the above criteria cannot be met, the container must be managed as hazardous waste and be disposed of through EH&S.

2. Glass Waste

- A labeled, puncture-resistant container must be used for glass waste.
- Non contaminated broken glass waste must be properly packaged prior to being disposed of in regular trash.
- Broken glass boxes are available from the Warehouse or substitute with a cardboard box, taped closed and labeled “caution-broken glass.”
- No solids or liquids are allowed in the broken glass waste containers.
- Glass waste is removed by Facilities Development & Operations personnel.

3. Sharps Waste

The Environmental Protection Agency (EPA) and Connecticut Department of Energy & Environmental Protection (DEEP) require sharps waste (e.g., needles, scalpel blades, hypodermic needles, syringes (with or without attached needles) and needles with attached tubing, regardless of contact with infectious agents, to be managed as “Regulated Medical Waste.”

Other sharps that can puncture or tear autoclave bags including Pasteur pipettes, disposable pipettes, razor blades, blood vials, test tubes, pipette tips, broken plastic culture dishes, glass culture dishes, and other types of broken and unbroken glass waste (e.g., microscope slides and cover slips) that may have been in contact with infectious material must also be managed as sharps.

All sharps generated in labs must be disposed of in approved sharps containers.

**Caution**: Sharps derived from injections with P-Listed chemicals (e.g., sodium azide, osmium tetroxide, epinephrine) must be disposed of in black sharps containers provided by EH&S upon request.

4. Gas Cylinder Returns/Disposal

EH&S does not manage the return or disposal of compressed gas cylinders. Lab personnel using cylinders must return empty and/or unused compressed gas cylinders to the supplier. EH&S recommends checking with the supplier, prior to purchase, to ensure acceptance of empty or partially used cylinders. If the supplier will not accept the cylinders, contact EH&S.
5. **Biological Waste**

Procedures for the treatment and disposal of biological and regulated medical waste are outlined in the *Regulated Medical Waste/Biological Waste Guidance*. Principal investigators, laboratory/facility managers, lab personnel, and others generating biological and/or regulated medical waste in UConn Health labs are responsible for compliance with the federal and state regulations and UConn Health procedures indicated in the guide.

The mixing of biological and hazardous chemical wastes should be avoided. If biological waste is mixed with hazardous chemicals, the entire mixture must be managed as **hazardous waste**.

6. **Radiological Waste**

Prior authorization must be obtained from the Radiation Safety Committee to use radioactive material. Procedures for authorized, proper disposal of radioactive waste generated in UConn Health’s labs must be carried out as indicated in the *Radiation Safety Notebook*. Principal investigators, laboratory/facility managers, and lab personnel generating radioactive wastes are responsible for compliance with the federal and state regulations and UConn Health’s procedures indicated in the manual.

Mixed wastes that contain both hazardous waste and radioactive material are regulated by the Environmental Protection Agency (EPA) and the Nuclear Regulatory Commission (NRC). No mixed waste (i.e., regulated hazardous waste contaminated with radioactive material) shall be generated unless prior authorization is obtained through the Radiation Safety Committee and/or the Radiation Safety Officer.

Principal investigators, laboratory/facility managers, and lab personnel are responsible for contacting EH&S prior to the generation of mixed waste containing hazardous chemicals and radioactive materials.

**Waste Stream Disposal – Quick Sheet**
7. Aerosol Cans (Including Hand Sanitizer)

Aerosol cans that have any remaining product must be treated as a hazardous waste and disposed of through EH&S. Dispensing the contents for the sole purpose of emptying the container is forbidden. Aerosol cans that are empty at ambient pressure are not regulated but are eligible for inclusion in UConn Health’s recycling/sustainability efforts. Collection receptacles and collection sites are located throughout the campus. Questions should be directed to EH&S 860-679-2723.

XIII. Chemical-Specific Procedures

A. Toxic Chemicals

Chemicals used in laboratories have a wide range of physical, chemical, and toxicological properties that lead to adverse health effects in humans. The risks associated with their use are dependent on both the level of exposure and the inherent toxicity of the chemical. The most important factor that determines whether a substance is toxic to an individual is the relationship between the amount of the chemical reaching the target organ and the toxic effect it produces. In some cases, a single (acute) exposure may bring about negative health effects whereas other toxic effects may be revealed after repeated, long-term (chronic) exposures. Many toxic effects from chemicals are reversible (i.e., causing no permanent damage) whereas other exposures can lead to permanent damage and even death at a sufficient dose, duration, and/or frequency.

Exposure to chemicals in the laboratory occurs by four routes:

- Inhalation into the respiratory tract,
- Absorption through the skin via dermal contact,
- Ingestion into the digestive tract, and
- Injection directly into the bloodstream.

PIs, laboratory/facility managers, and other lab personnel are responsible for using engineering controls, administrative controls, work practices, and personal protective equipment to eliminate or minimize exposure to toxic chemicals in labs.

1. Exposure Limits

Exposure to toxic chemicals in laboratories can lead to negative health effects in susceptible individuals. As a result, the Occupational Safety & Health Administration (OSHA), American Conference of Governmental Industrial Hygienists (ACGIH) and
National Institute for Occupational Safety and Health (NIOSH) have established exposure limits for chemicals to protect individuals from workplace hazards. OSHA’s action levels and permissible exposure limits (PELs) are enforceable by law. Descriptions of exposure limits located in safety data sheets are listed below:

<table>
<thead>
<tr>
<th>Exposure Limit</th>
<th>Description</th>
<th>Regulatory Agency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action level</td>
<td><em>Action level</em> means a concentration designated for a specific substance, calculated as an 8-hour time-weighted average, which initiates certain required activities such as exposure monitoring and medical surveillance.</td>
<td>OSHA</td>
</tr>
<tr>
<td>Immediately Dangerous To Life or Health (IDLH)</td>
<td>An IDLH condition is defined as a situation that poses a threat of exposure to airborne contaminants when that exposure is likely to cause death or immediate or delayed permanent adverse health effects or prevent escape from such an environment.</td>
<td>NIOSH</td>
</tr>
<tr>
<td>Permissible Exposure Limits (PELs)</td>
<td><em>PELs</em> are regulatory limits based on the amount or concentration of a substance in the air. In some cases, they may also contain a skin designation. Most <em>PELs</em> are based on an 8-hour time weighted average (TWA) exposure to which it is believed most workers may be exposed to for a working lifetime without developing serious illness.</td>
<td>OSHA</td>
</tr>
<tr>
<td>Recommended Exposure Limits (RELS)</td>
<td><em>RELS</em> are time-weighted average (TWA) concentrations for up to a 10-hour workday during a 40-hour workweek.</td>
<td>NIOSH</td>
</tr>
<tr>
<td>Threshold Limit Values (TLVs)</td>
<td><em>Threshold Limit Values (TLVs)</em> are based on the TWA concentration for a conventional 8-hour workday and a 40-hour workweek, to which it is believed that nearly all workers may be repeatedly exposed, day after day, for a working lifetime without adverse effect.</td>
<td>ACGIH</td>
</tr>
<tr>
<td>Threshold Limit Value- Ceiling (TLV–C)</td>
<td><em>TLV–C</em> is the concentration that should not be exceeded during any part of the working exposure. If instantaneous measurements are not available, sampling should be conducted for the minimum period of time sufficient to detect exposures at or above the ceiling value.</td>
<td>ACGIH</td>
</tr>
</tbody>
</table>
**Short-Term Exposure Limit (STEL)**

Short-Term Exposure Limit (STEL) is a 15-minute TWA exposure that should not be exceeded at any time during a workday, even if the 8-hour TWA is within the TLV–TWA. The STEL is the concentration to which it is believed that workers can be exposed continuously for a short period of time without suffering from 1) irritation, 2) chronic or irreversible tissue damage, 3) dose-rate-dependent toxic effects, or 4) narcosis of sufficient degree to increase the likelihood of accidental injury, impaired self-rescue or materially reduced work efficiency.

ACGIH

OSHA requires that safety data sheets list not only the relevant OSHA PEL but also the TLV and any other exposure limit used or recommended by the chemical manufacturer, importer, or employer preparing the safety data sheet. Since only approximately 500 PELs have been established, many chemicals used in laboratories do not have recognized exposure limits. In such cases, comparison of the chemical lacking an exposure limit to other chemicals with similar structures (e.g., hydrocarbons) or physical properties (e.g., volatile organic compounds) may be necessary. Lab workers must contact the principal investigator, laboratory/facility manager, or EH&S with questions or concerns regarding exposure limits for specific chemicals used in the lab.

2. Factors Affecting Toxicity

Toxicology is based on the relationship between a toxic reaction (the response) and the amount of toxicant received (the dose). The dose-response relationship is the basic concept for determining the relative level of harmfulness of a chemical. In a sufficient amount, even chemicals normally considered “harmless” can evoke a toxic response. Exposure to toxic chemicals is dependent on a number of factors listed in the table below:

<table>
<thead>
<tr>
<th>Route of Entry</th>
<th>Excretion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Condition</td>
<td>Combined effects of chemicals</td>
</tr>
<tr>
<td>Dose</td>
<td>Presence of other chemicals</td>
</tr>
<tr>
<td>Frequency</td>
<td>Stress</td>
</tr>
<tr>
<td>Ability to be absorbed</td>
<td>Sensitivity</td>
</tr>
<tr>
<td>Metabolism</td>
<td>Gender</td>
</tr>
<tr>
<td>Distribution within body</td>
<td>Individual Variation</td>
</tr>
</tbody>
</table>
Lab personnel are responsible for using engineering controls (e.g., fume hoods, gloveboxes, etc.), following UConn Health and lab-specific standard operating procedures and wearing appropriate personal protective equipment to prevent exposure to toxic chemicals.

3. Signs and Symptoms of Chemical Exposures

Signs and symptoms of chemical exposures can occur after single or repeated exposures. Some individuals develop a sensitivity (i.e., an allergic reaction) in normal tissue after repeated exposure to certain chemicals (e.g., chromium, nickel, formaldehyde, isocyanates, etc.). The following table is a list of common signs and symptoms associated with chemical exposures:

<table>
<thead>
<tr>
<th>Category</th>
<th>System Affected</th>
<th>Symptoms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dermatological</td>
<td>Skin, Eyes</td>
<td>Abnormally dark or light skin, burning sensation, itching, rashes, redness, swelling</td>
</tr>
<tr>
<td>Gastrointestinal</td>
<td>Stomach, Intestines</td>
<td>Diarrhea, nausea, vomiting</td>
</tr>
<tr>
<td>Hematological</td>
<td>Blood</td>
<td>Anemia (fatigue, weakness)</td>
</tr>
<tr>
<td>Neurological</td>
<td>Brain, Spinal Cord</td>
<td>Confusion, coma, convulsions, coordination difficulty, depression, dizziness, headache, sweating</td>
</tr>
<tr>
<td>Renal</td>
<td>Kidney</td>
<td>Back pain, frequent or infrequent urination</td>
</tr>
<tr>
<td>Reproductive</td>
<td>Ovaries, Testes, Fetus</td>
<td>Infertility, miscarriage</td>
</tr>
<tr>
<td>Respiratory</td>
<td>Nose, Trachea, Lungs</td>
<td>Irritation, choking, coughing, runny nose, sneezing, tight chest</td>
</tr>
</tbody>
</table>

Lab personnel experiencing any signs or symptoms of chemical exposures must contact their principal investigator, laboratory/facility manager, or EH&S prior to conducting further research.
B. Flammable Liquids

The Occupational Safety & Health Administration (OSHA) defines a flammable liquid as having a flash point of not more than 93°C (199.4°F). OSHA defines **flash point** as “the minimum temperature at which a liquid gives off vapor within a test vessel in sufficient concentration to form an ignitable mixture with air near the surface of the liquid.” In most cases, the relative hazard of a flammable liquid increases as the flashpoint decreases. Many common solvents (e.g., acetone, diethyl ether, toluene, etc.) have flash points well below room temperature, making proper use, storage and disposal even more critical. Flammable liquids and mixtures containing flammable liquids are assigned to one of four hazard categories, as indicated in safety data sheets (SDSs), based on their flash points and boiling points (See table below).

### Table 27. Flammable Liquid Categories

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
<th>Hazard Statement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Flash point &lt; 23°C and initial boiling point ≤ 35°C (95°F)</td>
<td>Extremely flammable liquid and vapor</td>
</tr>
<tr>
<td>2</td>
<td>Flash point &lt; 23°C and initial boiling point &gt; 35°C (95°F)</td>
<td>Highly flammable liquid and vapor</td>
</tr>
<tr>
<td>3</td>
<td>Flash point ≥ 23°C and ≤ 60°C (140°F)</td>
<td>Flammable liquid and vapor</td>
</tr>
<tr>
<td>4</td>
<td>Flash point ≥ 60°C (140°F) and ≤ 93°C (200°F)</td>
<td>Combustible liquid</td>
</tr>
</tbody>
</table>

Table derived from **OSHA 1910.1200 Appendix B**.

For a flammable liquid to ignite, three conditions must exist simultaneously: (1) the concentration of the vapor must be between the upper and lower flammable limits of the substance; (2) an oxidizer (usually the oxygen in air) must be present; and (3) a source of ignition must be present. Taking measures to remove any of these conditions will prevent the start of a fire. Additional information on flammable liquids can be found at the fact sheet titled **Flammable Liquids- Safe Work Practices**.

1. **Work Practices**

   - Work with flammable liquids in a properly functioning chemical fume hood, glovebox or other source of local ventilation.
   - Keep flammable liquid containers closed when not in use.
   - Control all ignition sources in areas where flammable liquids are used.
Never heat flammable substances using an open flame. Use oil baths, steam baths, water baths, heating mantles, or hot air baths.

Do not distill flammable substances under reduced pressure.

Make sure that metal surfaces or containers where flammable substances are being used are properly grounded, discharging static electricity.

Identify the locations of fire alarms, pull stations, safety showers, and other emergency equipment.

2. Storage

Flammable liquids should be stored in the specifically designed chemical storage rooms (H Rooms) or in rated flammable storage or explosion-proof cabinets when not in use.

Venting of flammable storage cabinets is not required for fire protection purposes and should be avoided. Vent openings shall be sealed with bungs.

Storage cabinets of flammable material must be labeled with, at a minimum, the word “Flammable.”

Paper, cardboard, or other combustible material must not be stored in flammable storage cabinets.

Flammable liquid storage areas must be free of ignition sources (e.g., electrical outlets, open flames, hot surfaces, static electricity, etc.).

Storage of flammable liquids or other hazardous chemicals on floors should be avoided.

Flammable liquid quantities in laboratories must comply with UConn Health’s Fire Department standards.

Any refrigerator that is used to store flammable liquids must be designed for flammable or explosive storage (i.e., contain no ignition sources such as exposed electrical contacts) and be properly labeled.

Flammable liquids must be stored separately from strong oxidizers, corrosives, and other incompatible materials.

Storage of flammable liquids must not block any route of egress.

C. Corrosive Chemicals

Corrosive chemicals can cause immediate damage to the skin, eyes, tissues, and other parts of the body upon contact. Some chemicals may be corrosive to metals. Both acidic (pH < 4) and alkaline (pH >10) solutions are capable of causing chemical burns. Severity is dependent primarily upon the concentration of the chemical and the duration of contact. Exposure to corrosive chemicals can produce ulcers, bleeding, bloody scabs, skin discoloration, alopecia, scars, and other serious conditions. Below is a table of
common corrosive hazard classes, storage methods, and examples of each class:

### Table 28. Corrosive Liquid Classes and Storage Guidelines

<table>
<thead>
<tr>
<th>Corrosive Classes</th>
<th>Storage</th>
<th>Examples</th>
</tr>
</thead>
</table>
| Inorganic Acids   | • Store in corrosives cabinet or on protected shelving and in secondary containment away from organic acids and bases.  
                    • Avoid storage on metal shelving.                                    | Hydrochloric acid, Hydrofluoric acid, Phosphoric acid, and Sulfuric acid |
| Inorganic Bases   | Store in corrosives cabinet away from acids.                            | Ammonium hydroxide, Potassium hydroxide, and Sodium hydroxide            |
| Organic Acids     | • Store in corrosives cabinet, on protected shelving, or in secondary containment away from inorganic acids and bases.  
                    • Avoid storage on metal shelving.                                    | Acetic acid, Trichloroacetic acid, and Formic acid                       |
| Organic Bases     | Store in corrosive cabinet away from acids and inorganic bases.         | Hydroxylamine, Tetramethylethylene diamine, and Triethylamine             |
| Oxidizing Acids   | Store alone or in a separate secondary containment bin with compatible, inorganic acids. | Perchloric acid, Nitric acid, and Chromic acid                           |

1. **Work Practices**

- Work with corrosive chemicals in a functional chemical fume hood, glovebox or other source of local ventilation.
- Properly label secondary containers with the appropriate chemical name and hazard class.
- Work within **10 seconds (55 feet)** of a properly functioning eyewash station and safety shower.
- Keep the corrosive chemical containers closed when not in use.
- Add acid in small quantities to the water to prevent spattering. Never add water to an acid.
- EH&S requires tight-fitting safety goggles, chemical-appropriate gloves, lab coats, and long pants for all work with corrosive liquids.
- Research with hydrofluoric acid requires calcium gluconate gels or
benzalkonium chloride in the immediate work area for emergency use. Expired calcium gluconate gels and/or benzalkonium chloride solutions must be replaced prior to research with hydrofluoric acid/sodium fluoride.

- Hydrofluoric acid and/or sodium fluoride have specific requirements for safe use. Contact EH&S.

2. Storage

- Chemicals that are corrosive, toxic, or injurious to the eye must be stored below eye level.
- Segregate inorganic acids from organic acids in separate cabinets or in separate secondary containment bins within the same cabinet.
- Store acids and bases in separate cabinets.
- Segregate acids from reactive metals (e.g., sodium, potassium, etc.), azides, and cyanides.
- Oxidizing acids, such as concentrated perchloric and nitric acids, must be stored in a separate cabinet or secondary containment bin, away from organic materials and other incompatible chemicals.

D. Particularly Hazardous Substances (PHSs)

The OSHA Laboratory Standard requires that employees take additional safety precautions while working with particularly hazardous substances (i.e., carcinogens, reproductive toxins, and chemicals with a high degree of acute toxicity). These provisions include:

1. Establishment of a designated area, use of containment devices such as fume hoods or gloveboxes,
2. Procedures for safe removal of contaminated waste, and
3. Decontamination procedures.

Lab personnel using carcinogens, reproductive toxins, and acutely toxic chemicals are responsible for complying with the OSHA Lab Standard. Principal investigators and/or laboratory/facility managers are responsible for training, providing appropriate personal protective equipment (PPE), and approval of procedures using particularly hazardous substances in their labs. EH & S is available to assist you with this process.
1. **Identification of Particularly Hazardous Substances**

   a. **Carcinogens** are substances or a mixture of substances, which cause cancer or increase its incidence. Carcinogenic chemicals are classified into one of three categories based on the strength of evidence in experimental studies. The categories are listed below:

   - Category 1A- Known Human Carcinogens
   - Category 1B- Presumed Human Carcinogens
   - Category 2- Suspected Human Carcinogens

   The category of carcinogenic substance can be identified through safety data sheets (SDSs). Carcinogenic chemicals listed as **Category 1A, Category 1B, or Category 2** must be managed as a particularly hazardous substance.

   Carcinogenic chemicals listed in the following groups by OSHA, the National Toxicology Program, and International Agency for Research on Cancer Monographs can be used to identify carcinogenic chemicals to be managed as PHSs:

   - Occupational Safety & Health Administration (OSHA)
   - National Toxicology Program (NTP)— Groups “Known To Be Human Carcinogens” and “Reasonably Anticipated To Be Human Carcinogens”

   b. **Reproductive Toxins** are substances or a mixture of substances that affect the reproductive capabilities including adverse effects on sexual function and fertility in adult males and/or females, as well as adverse effects on the development of the offspring. Reproductive toxins are divided into three categories:

   - Category 1A- Known human reproductive toxicant,
   - Category 1B- Presumed human reproductive toxicant, and
   - Category 2- Suspected human reproductive toxicant.

   **Category 1A, Category 1B, and Category 2** reproductive toxicants as well as reproductive toxins known to have effects on or via lactation, as indicated in safety data sheets (SDSs), must be managed as a particularly hazardous substances.
c. **Acute toxicity** refers to substances producing adverse health effects following oral or dermal administration of a single dose of a substance, or multiple doses given within 24 hours, or an inhalation exposure of 4 hours. OSHA currently characterizes acutely toxic substances into four categories based on toxicity by the oral, dermal, or inhalation routes. The categories are listed in the table below:

<table>
<thead>
<tr>
<th>Exposure Route</th>
<th>Category 1</th>
<th>Category 2</th>
<th>Category 3</th>
<th>Category 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oral (mg/kg bodyweight)</td>
<td>≤ 5</td>
<td>&gt;5 and ≤ 50</td>
<td>&gt;50 and ≤ 300</td>
<td>&gt;300 and ≤ 2000</td>
</tr>
<tr>
<td>Dermal (mg/kg bodyweight)</td>
<td>≤ 50</td>
<td>&gt;50 and ≤ 200</td>
<td>&gt;200 and ≤ 1000</td>
<td>&gt;1000 and ≤ 2000</td>
</tr>
<tr>
<td>Inhalation - Gases (ppmV)</td>
<td>≤ 100</td>
<td>&gt;100 and ≤ 500</td>
<td>&gt;500 and ≤ 2500</td>
<td>&gt;2500 and ≤ 20000</td>
</tr>
<tr>
<td>Inhalation - Vapors (mg/l)</td>
<td>≤ 0.5</td>
<td>&gt;0.5 and ≤ 2.0</td>
<td>&gt;2.0 and ≤ 10.0</td>
<td>&gt;10.0 and ≤ 20.0</td>
</tr>
<tr>
<td>Inhalation - Dusts/Mists (mg/l)</td>
<td>≤ 0.05</td>
<td>&gt;0.05 and ≤ 0.5</td>
<td>&gt;0.5 and ≤ 1.0</td>
<td>&gt;1.0 and ≤ 5.0</td>
</tr>
</tbody>
</table>

*Table derived from OSHA 1910.1200 App A.*

Individuals can identify the category of an acutely toxic substance through the safety data sheet (SDS). Acutely toxic chemicals listed as **Category 1** or **Category 2** must be managed as particularly hazardous substances. Procedures for **Category 3** and **Category 4** acutely toxic substances must be evaluated by the principal investigator.

2. **Management of Particularly Hazardous Substances**

In addition to the UConn Health’s [standard operating procedures](#) required for research with hazardous chemicals as outlined in the CHP, researchers working with PHSs also must follow the additional procedures listed below.

a. **Establishment of a Designated Area in the Lab**

1) Particularly hazardous substances must only be used and stored in designated areas.

2) The designated area may be a fume hood, glovebox, an entire laboratory, or other suitable area recognized by authorized personnel working in the lab.
3) Signs must be posted in designated areas where particularly hazardous substances are used. The sign(s) for individual or multiple hazards must state:

<table>
<thead>
<tr>
<th>DANGER CANCER HAZARD</th>
<th>DANGER REPRODUCTIVE HAZARD</th>
<th>DANGER ACUTE TOXIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorized Personnel Only</td>
<td>Authorized Personnel Only</td>
<td>Authorized Personnel Only</td>
</tr>
</tbody>
</table>

**The design of the sign(s) can be modified to suit the needs of the lab**

4) The designated area may be used for other research purposes as long as laboratory personnel comply with UConn Health’s standard operating procedures, training requirements, and emergency procedures.

b. Use of Containment Devices Such as Fume Hoods or Gloveboxes

1) Most research using particularly hazardous substances (PHSs) should take place in a fume hood, glovebox, or other suitable containment device. If use of a suitable containment device is not feasible, EH&S must be contacted to discuss alternative containment and/or safety protocols.

2) Fume hoods being used for research with PHSs should be running between 80-120 linear feet per minute and have been inspected by EH&S within the last year. If the fume hood has a Pass sticker and has not been tested in the last year, contact EH&S at x-2723.

3) Gloveboxes can be used when protection from atmospheric moisture or oxygen is necessary, or when a fume hood does not provide adequate protection from exposure. Gloveboxes must be installed and maintained per manufacturer specifications to ensure proper function.

c. Procedures for Safe Removal of Contaminated Waste

1) Waste generated using particularly hazardous substances must be managed accordingly at your S.A.A. location.
   - Properly labeled and containerized.
d. Decontamination Procedures

1) All equipment, glassware, and materials used for research with particularly hazardous substances (PHSs) must be properly decontaminated.

2) Procedures must outline methods of decontamination for all equipment that comes into contact with particularly hazardous substances.

3) Manufacturer’s instructions and specifications must be used to identify proper methods to decontaminate equipment.

4) Decontamination of equipment should take place in fume hoods, if feasible.

5) All work surfaces must be decontaminated at the end of the procedure or workday.

6) Equipment contaminated with PHSs must never be removed from the lab without complete decontamination.

7) After decontamination procedures are completed, trained laboratory personnel must properly wash hands and any other body areas that have potentially contacted PHSs.

E. Highly Reactive and Explosive Chemicals

Some hazardous chemicals in laboratories may become highly reactive or explosive when exposed to certain environmental conditions (e.g., heat, fire, water, air, etc.). Others become explosive when they contact incompatible materials, are allowed to dry out, decompose, or encounter sources of friction or mechanical shock. Due to the high hazards associated with such compounds the principal investigator/lab manager/supervisor must verify and document appropriate procedures, control measures, personal protective equipment, and training are completed prior to use. Failure to comply with safety measures can lead to explosions, fires, property damage, or serious injuries.

1. Classes of Highly Reactive and Explosive Chemicals

Many chemicals are classified as highly reactive or potentially explosive. A table of the hazard classes, pictograms, and examples of each class is listed below.
Table 30. Classes of Highly Reactive and Explosive Chemicals

<table>
<thead>
<tr>
<th>Hazard Class</th>
<th>Pictogram</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chemicals that produce flammable gases when in contact with water</td>
<td>![Flammable Gas Icon]</td>

<td>![Self-Reactive Icon]</td>
<td>2,2'Azobisisobutyronitrile</td>
</tr>
</tbody>
</table>

2. Procedures for Highly Reactive Chemicals

Due to the inherent risks involved with the use of highly reactive chemicals, measures must be taken to assess the risks and control hazards prior to engaging in active experimentation. Conducting “dry runs” of high hazard experiments is recommended to reinforce proper techniques, safety measures, and emergency procedures. The guidelines listed below must be followed when handling high hazard chemicals.
a. Administrative Controls

- Use the minimum amount of chemical(s) needed to achieve the desired outcome.
- Avoid working alone with highly reactive chemicals.
- NEVER deviate from standard operating procedures unless previously discussed and agreed upon with the principal investigator.
- Alert other individuals working in the lab on what experiment is being conducted, the potential hazards, and when the experiment will be run.
- Restrict access to areas where high-scale reactions are taking place.

b. Engineering Controls

- Research involving highly reactive chemicals must be performed in a properly functioning fume hood, glovebox, or with another form of ventilation approved by the principal investigator or laboratory/facility manager.
- The principal investigator or laboratory/facility manager must determine whether properly rated safety shields, barricades, and guards are necessary to protect lab personnel and equipment from injury or damage. The barrier should surround the hazardous area if feasible.
- If more than one hazardous reaction is carried out simultaneously, the reactions must be shielded from each other and separated as far apart as possible.
- Adequate grounding must be implemented to prevent static sparks from acting as ignition sources.

c. Work Practices

- All containers holding highly reactive materials must be clearly labelled.
- Do not use metal or wooden devices when stirring, cutting, or scraping potentially reactive compounds. Non-sparking devices must be used.
- Ensure safety devices (e.g., high temperature controls, water overflow devices, etc.) are used to minimize potential incidents.
- Chemicals known to become explosive when dry must be regularly inspected and wetted as needed per manufacturer’s instructions.
- Chemicals known to become explosive after a period of time (e.g., peroxide-forming chemicals) must be labeled with the date the bottle was delivered to the lab and the date the bottle was first opened, and they must be tested qualitatively with peroxide test strips per the manufacturer’s SDS.
recommendations.

- Keep all sources of ignition away from reactive materials
- When highly reactive materials are in use, a safety shower, eyewash station, and other safety equipment specific for the hazards involved, must be present in the laboratory.

d. Personal Protective Equipment

- Laboratories are responsible for providing the appropriate level of PPE for their employees.
- Wear personal protective equipment as indicated in safety data sheets (SDSs) and the lab’s Workplace Hazard Assessment Form.
- At a minimum, lab coats, appropriate gloves, clothing that covers the legs, closed-toed footwear, and chemical splash goggles or safety glasses that meet American National Standards Institute (ANSI) standard Z-87.1 must be worn when working with highly reactive chemicals.
- Lab coats must be appropriately constructed, sized, buttoned, and fit properly to cover as much skin as possible. Principal investigators or laboratory/facility managers must determine if specialized lab coats are required.
- Closed-toed footwear must cover the entire foot.
- Principal investigators or laboratory/facility managers must determine when full-length shields that protect the entire face and throat are required.
- Leather and/or other suitable gloves (e.g., Nomex) should be worn if researchers must reach behind a shielded area while a hazardous experiment is in progress or when handling high hazard chemicals.
- Additional personal protective equipment required by the PI or laboratory/facility manager must be worn by lab personnel based on the chemicals in use and the risks involved.

e. Storage

- Store in a designated storage area or cabinet with limited access.
- Additional storage precautions (e.g., a refrigerator, a flammable liquid storage cabinet, or a fume hood) may be required for certain compounds based upon chemical properties.
- Store away from incompatible materials.
  Keep away from ignition sources such as open flames, hot surfaces, spark sources, and direct sunlight.
- Storage in chemically compatible secondary containment bins is recommended to contain highly reactive or explosive chemicals in the event of a leak or spill.
- Never store unlabeled chemicals.

F. Compressed Gas Cylinders

Compressed gases can pose serious hazards when mishandled. Damage to the valve or integrity of a cylinder can result in a large release of potential energy, transforming the cylinder into a potential rocket or fragmentation bomb. Safe management of cylinders requires both an understanding of the chemical hazards associated with each gas (e.g., toxic, flammable, oxidizing, inert, or a combination of hazards) as well as an awareness of the other physical hazards resulting from the high pressures contained in each cylinder (e.g., asphyxiation, decompression, etc.). Safety data sheets (SDSs) must be reviewed prior to the handling, storage, or transport of any pressurized gas. In addition, training must be provided by principal investigators, laboratory/facility managers, or a qualified vendor when new gases, or new equipment that uses compressed gases, are brought into laboratories.

1. Types of Gases under Pressure

The Occupational Safety & Health Administration (29 CFR 1910.1200- Appendix B) classifies gases under pressure based on pressure, temperature, and physical state. The four categories and criteria for gases under pressure are listed in the table below:
### Table 31. Types of Gases under Pressure

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressed gas</td>
<td>A gas which when under pressure is entirely gaseous at -50°C (-58°F), including all gases with a critical temperature ≤ -50°C (-58°F) (e.g., Helium, Nitrogen, Oxygen, and Argon).</td>
</tr>
<tr>
<td>Liquefied gas</td>
<td>A gas which, when under pressure, is partially liquid at temperatures above -50°C (-58°F) (e.g., Ammonia, Carbon dioxide, Propane). A distinction is made between: 1. High pressure liquefied gas: a gas with a critical temperature between -50°C (-58°F) and +65°C (149°F); and 2. Low pressure liquefied gas: a gas with a critical temperature above +65°C (149°F).</td>
</tr>
<tr>
<td>Refrigerated liquefied gas</td>
<td>A gas which is made partially liquid because of its low temperature (e.g., Liquid Nitrogen).</td>
</tr>
<tr>
<td>Dissolved gas</td>
<td>A gas which when under pressure is dissolved in a liquid phase solvent (e.g., Acetylene).</td>
</tr>
</tbody>
</table>

*Table derived from [OSHA 1910.1200 Appendix B](#)*

2. **Work Practices**

- The contents of each cylinder must be clearly labeled. Do not accept cylinders from manufacturers without appropriate labels.
- Never write on cylinder labels. Labels are required to be free of markings for proper identification and safe transport.
- A cylinder cap or regulator valve must be in place at all times.
- Each cylinder must be secured with a chain, strap, or cable to a wall or lab bench that can support the weight of the cylinder.
- Cylinders restraints (e.g., chain, strap, etc.) must be secured at least halfway up the body of the cylinder.
- Cylinder restraints must be kept tight to restrict cylinder movement.
- Cylinders must be secured individually (i.e., one restraint per cylinder), unless cages, racks, or stands are designed to support multiple cylinders.
- Obtain gas cylinders in returnable canisters whenever feasible. Fees associated with the proper disposal of non-returnable canisters (e.g., lecture bottles) may be charged to the PI/department.
  - Lecture bottles require prior EH&S approval.
- Order bottles with the lowest cylinder pressure possible for its intended purpose.
- Bond and ground all cylinders, lines, and equipment used with flammable compressed gases.
- Flammable compressed gases must be approved by UConn Fire Department and EH&S prior to use.
- Never drag, roll, or slide cylinders.
- The regulator and cylinder must be accessible at all times.
- Do not place cylinders where they may become part of an electric circuit.
- When discharging gas into a liquid, a trap or suitable check valve must be used to prevent liquid from returning back to the cylinder or regulator.
- Appropriate personal protective equipment must be provided to lab personnel for the specific gases being used.

3. Regulators, Piping & Fittings
   - Use only the regulator designed for the specific gas being used.
   - Regulator valves must be kept closed when equipment is not in use.
   - Regulators, valves, hoses, and distribution lines must be free of oil or grease and examined for leaks or other damage before each use.
   - Valves, piping, and fittings must be rated for the pressures, temperatures, and gases being used.
   - Do not force threads that do not fit.
   - Avoid mixing different brands and types of tube fittings. Construction of parts is brand-specific they are usually not interchangeable.
   - Never use parts with damaged or partly stripped threads.
   - Never use oil or lubricants on equipment used with oxygen, unless specifically approved for the application (e.g., Krytox).
   - If a cylinder valve cannot be opened by hand, do not use tools to open the valve. Contact the UConn contract vendor or manufacturer and have cylinder replaced.

4. Tubing & Hoses
   - Label all gas lines with the chemical name leading from a compressed gas supply.
   - Instrument connective tubing and hoses must be rated and compatible for the gases being used.
   - Inspect tubing frequently and replace when necessary.
   - Tygon® and plastic tubing are not appropriate for most pressure work. These materials can fail under pressure or thermal stress.
   - Never use Teflon™ tape on CGA (Compressed Gas Association) fittings (i.e., straight thread) where the seal is made by a metal-to-metal contact. Use of Teflon™ tape causes the threads to spread and weaken, increasing the likelihood of leaks.
- Tubing/hoses connected to compressed gas cylinders must not be laid across floors or aisles where they could create a trip or fall hazard.
- Avoid sharp bends of copper tubing. Copper tubing can crack with repeated bending.
- Brass, copper, or other tubing material incompatible with ammonia shall not be used.
- Do not mix different brands and types of tubing. Parts are usually not interchangeable.
- Consult the gas manufacturer if you are unsure about the particular connection for your cylinders.

5. Pressure-Relief Devices

- Pressure-relief devices and associated fittings (tubing, connectors, etc.) must be properly sized and configured to provide a sufficient rate of pressure relief while preventing over-pressurization.
- Pressure-relief devices that may discharge toxic, corrosive, flammable, or otherwise hazardous or noxious materials must be properly vented.
- Do not install valves or other shutoff devices between pressure-relief devices and the equipment they are to protect.
- Do not install shutoff valves downstream of the relief device.
- Ensure that the relief vent is not blocked or restricted.
- Tubing and piping downstream of pressure relief devices must be at least the same diameter as the fitting on the vent side of the relief device.
- Only qualified persons can perform maintenance work on pressure-relief devices.

6. Storage & Disposal

- All cylinders must be stored upright.
- Store in cool, well-ventilated areas (not in cold rooms) away from direct sunlight and sources of heat and ignition.
- Do not expose cylinders to temperatures exceeding 125°F.
- Do not artificially heat cylinder in an attempt to raise internal pressure.
- All cylinders must be stored based on hazard class.
- Keep the number of cylinders to a minimum.
- Do not store cylinders where heavy-moving objects may strike or fall on them.
- Compressed gas cylinders must be stored away from exits.
- Cylinder storage areas must be protected from access by unauthorized personnel.
• Do not store corrosives near gas cylinders. Corrosive vapors from mineral acids can deface markings and damage valves.
• Oxidizing gases must be stored at least 20 feet away from flammable chemicals (e.g., hydrogen) or the storage area must be separated by a firewall at least 5 feet high and have a fire resistance rating of 30 minutes.
• Cylinders containing corrosive and toxic gases (e.g., arsine, ammonia, carbon monoxide, chlorine, ethylene oxide, fluorine, hydrogen sulfide, hydrogen cyanide, phosgene, silane, etc.) require prior approval from EH&S and must be stored in locations with suitable exhaust (e.g., ventilated gas cabinet, fume hood, etc.).
• Separate and secure full and empty cylinders.
• When returning an empty cylinder, close the valve, secure the cylinder cap, label the cylinder “EMPTY” and contact the UConn Health’s contract vendor or manufacturer to remove the cylinder from the lab.

7. Transport

• At a minimum, protective eyewear must be worn during transport of gas cylinders.
• Cylinder caps must be in place (i.e., never transport a cylinder with a regulator in place).
• Transport one cylinder at a time.
• Cylinders must be moved on an approved cart and secured with a strap or chain.
• Cylinders must never be rolled on their sides or dragged.
• Contact the vendor to transport cylinders between buildings, or as needed.

G. Cryogenic Liquids

A cryogenic liquid is defined as a liquid with a boiling point below -90°C (-130°F) at 101.3 kPa (14.7 psi) absolute. Commonly used cryogenic liquids include liquid nitrogen, helium, and oxygen. Solid carbon dioxide (i.e., dry ice) is not a cryogen but can still be hazardous when not handled properly. Most cryogenic liquids are odorless, colorless, and tasteless when vaporized. When cryogenic liquids are exposed to the atmosphere, the cold boil-off gases condense the moisture in the air, creating a highly visible fog.
Hazards associated with cryogenic liquids are listed in the table below:

<table>
<thead>
<tr>
<th>Hazard</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adhesion</td>
<td>Contact with tanks, piping, or equipment containing cryogenic liquids can cause skin to stick to the surface, tearing the skin during removal.</td>
</tr>
<tr>
<td>Asphyxiation</td>
<td>Cryogenic liquids can displace oxygen in the atmosphere due to large liquid-to-gas volume displacement ratios, typically about 700:1.</td>
</tr>
<tr>
<td>Explosion due to rapid expansion</td>
<td>Large liquid-to-gas ratios can lead to rapid pressure changes as cryogenic liquids vaporize. All cryogens can condense sufficient moisture from the air leading to freezing and blockage of the openings to storage vessels. Explosions can result from the build-up of trapped gases in the container.</td>
</tr>
<tr>
<td>Extreme cold and frostbite</td>
<td>Cryogenic liquids can freeze human tissue upon contact resulting in cold burns and frostbite.</td>
</tr>
<tr>
<td>Flammability</td>
<td>Liquid hydrogen has a wide flammability range, 4% to 74% in air, and requires a small amount of energy for ignition. To prevent formation of explosive mixtures in air, no ignition sources are allowed where liquid hydrogen is stored or handled. <strong>Any planned use of liquid hydrogen or other flammable cryogenic liquid must be reviewed by UCHFD.</strong></td>
</tr>
<tr>
<td>Oxygen-enriched air</td>
<td>Vaporization of liquid oxygen in an enclosed area can cause oxygen enrichment, which may cause or intensify a fire. Although oxygen does not burn, it will support combustion. Combustible materials (e.g., oil, grease, etc.) will become more likely to ignite, burn more vigorously, and may explode when exposed to oxygen-enriched materials. <strong>Any planned use of liquid oxygen must be reviewed by UCHFD.</strong></td>
</tr>
</tbody>
</table>

1. **Work Practices**

   - Read the safety data sheet for each cryogenic liquid prior to use.
   - Avoid eye or skin contact.
   - Work in a well-ventilated location. Avoid closets, cold rooms, and other locations with little or no ventilation. A leak in such an area could cause an oxygen-deficient atmosphere.
   - Monitors or oxygen deficient sensors and alarms are required for large volume usage. Check the monitors and alarms before and during cryogen use.
   - Examine containers and pressure relief valves for signs of defects prior to each use. Never use a container that has defects. Contact a cryogenic vendor for assistance.
- Do not allow liquid oxygen or oxygen-enriched air to come in contact with organic materials.
- Never touch uninsulated pipes or vessels containing cryogenic liquids.
- Carefully select working materials and equipment used with cryogenic liquids. Cryogenic liquids may alter the physical characteristics of many materials, making them brittle and leading to failure.
- Use non-metallic tongs or tongs with insulated handles to add or remove materials from cryogenic liquids.
- Verify there is pressure relief for any place where a pressure build-up could occur.
- Push, do not pull, Dewars with wheels if they need to be moved, unless otherwise instructed by the manufacturer. Pulling Dewars on wheels increases the risk of tipping.
- Do not ride on elevators when cryogenic liquids are being delivered by outside vendors.
- Schedule large Dewar fills during normal business hours, when staff are available to assist. If after-hours access is needed, it is recommended that other lab personnel be nearby to assist.
- If Dewars must be moved, clear all obstacles from the pathway before transport. Contact the UConn contract vendor or manufacturer for assistance with moving cylinders if necessary.
- If a Dewar pressure relief valve fails and causes improper or frequent venting, leave the lab, post a warning sign on the door(s) to the lab to prevent access and dial 911.

2. Personal Protective Equipment (PPE)

- Wear safety goggles when working with cryogenic liquids. Safety glasses do not provide sufficient protection.
- Wear a face shield together with safety goggles when filling Dewars or transferring cryogenic liquids from one container to another.
- Wear appropriate gloves designed for cryogenic liquids; do not leave skin exposed. Gloves must be loose-fitting to allow for quick removal if a cryogen leaks or is spilled into them.
- Most cryogenic gloves are designed for splash protection only. They are not designed for immersion into cryogenic liquids.
- Do not wear metal jewelry or watches.
- Closed-toed footwear is required when handling cryogenic liquids. Leather will shed the spilled liquid better than canvas or other absorbent materials.
- An apron made of leather or other non-absorbent material should be used when working with liquid cryogens. Most clothing material will absorb spilled liquid cryogens, increasing the risk of skin exposure.
- Review the *Workplace Hazard Assessment* to identify the specific PPE required by the principal investigator or laboratory/facility manager.

3. **Storage**

- Store cryogens in well-ventilated areas to prevent oxygen deficiency. Do not store any cryogenic material in cold rooms.
- Use only approved storage vessels that have pressure relief valves.
- Never adjust, block, or plug a pressure relief valve.
- Avoid contact with moisture during storage to prevent ice plugs in relief devices.
- Never store a cryogen in a sealed, airtight container at a temperature above the boiling point of the cryogen; the pressure resulting from the production of gaseous carbon dioxide or nitrogen may lead to an explosion.
- Periodically check container necks for ice plugs; core out ice plugs if present.
- Keep heat sources away from cryogenic liquids.
- Do not use cryogens or dry ice in cold rooms due to risk of asphyxiation.
- There are very specific requirements for use and/or shipping. Please contact EH&S for training requirements.

H. **Peroxide-Forming Chemicals**

Peroxide-forming compounds can become extremely hazardous if not managed properly. Several commonly used solvents (e.g., diethyl ether, tetrahydrofuran, dioxane, etc.) can form explosive peroxides through a relatively slow oxidation process in the presence of heat, light, moisture, oxygen, or impurities. Since most peroxide-forming chemicals are packaged in atmospheres containing air, even unopened bottles can produce peroxides. Refrigeration does not eliminate peroxide formation and stabilizers only slow down formation, and this is exacerbated when not inhibited.

Peroxide formation becomes evident when crystalline solids are observed in the liquid itself or around the bottle’s cap. Some peroxide-forming chemicals produce solutions that appear cloudy. Once peroxides have formed, they can react violently and/or explode when combined with other compounds or when disturbed by unusual heat, mechanical shock, impact, or friction. Visual inspection is the safest way to determine peroxide formation. If you suspect the presence of peroxides, contact Environmental Health and Safety at 860-679-2723.
The following table lists common peroxide-forming chemicals present in laboratories. The lists of chemicals in the table below are not comprehensive. Safety data sheets (SDSs) must be reviewed to indicate whether chemicals being utilized in the laboratory can form explosive peroxides.

<td>2-Ethoxyethyl</td>
</tr>
</tbody>
</table>
1. **Administrative Controls**

- Identify chemicals that form peroxides through safety datasheets.
- Solvents containing low levels of free radical scavengers such as butylated hydroxytoluene (BHT) should be used whenever the presence of the stabilizing species does not interfere with the intended application.
- Order only the quantities needed. Many uninhibited peroxide-forming chemicals (e.g., diethyl ether, tetrahydrofuran, etc.) used in labs must be tested or discarded after 12 months.
- Use old bottles before opening or ordering new ones.
- Store in tightly-sealed, opaque containers when not in use. Protect peroxide-forming chemicals from air, heat, moisture, light, or impurities.
- Do not store liquid peroxides or solutions of peroxides at a temperature below the point where the peroxide freezes or precipitates. Peroxides in this form are extremely shock and heat-sensitive.
- Store away from incompatible materials such as strong oxidizing and reducing agents.
- If materials must be refrigerated, store in an explosion-proof refrigerator.
- Test for peroxides or discard bottles that have exceeded the manufacturer’s expiration date. If the chemical has been tested, the test date must be written on the side of the bottle.

2. **Work Practices**

- Visually check for crystalline solids before each use.
- Label each bottle with the date received and the date the bottle was first opened.
- Never distill peroxide-forming solvents unless they have been tested and known to be free of peroxides. Peroxides concentrated in the residue can pose a serious explosion hazard.
- **Peroxide test strips must be used to test for the presence of peroxides. Testing must NOT be conducted on peroxide-forming chemicals that are of unknown age or origin (i.e., legacy waste, inherited chemicals) if crystals or discolored solids are present, or if the liquid appears cloudy. Contact EH&S x-2723 for evaluation and disposal.**
- Conduct procedures inside a chemical fume hood. The principal investigator must determine whether work behind a protective shield is also required.
- Reduce the sensitivity of peroxides to heat and shock by dilution with inert solvents.
- Avoid using solutions of peroxides in volatile solvents. Solvent evaporation must be controlled to avoid dangerous concentration of the peroxide.
- Do not allow peroxides to contact iron; compounds of iron, cobalt, or copper; metal oxide salts; acids, bases; or acetone.
- Do not handle peroxides with metal spatulas or magnetic stirring bars that could leach iron. Teflon™, ceramic, or wooden spatulas and stirring blades are recommended.
- Do not allow open flames, other sources of heat or sparks, friction, grinding, or forms of impact near peroxides.
- Do not return unused peroxide-forming chemicals to the original container.

I. Nanomaterials

Nanotechnology involves the engineering, manipulation, and control of particles with lengths in two or three dimensions from 1 to 100 nanometers (1 nanometer is 1 billionth of a meter). In this size range, particles begin to exhibit unique characteristics that influence chemical, physical, and biological behaviors. Research on a nanometer scale involves the production, design, and examination of materials with specific properties related to shape, size, surface area, porosity, and chemistry. Though current and future applications involving nanomaterials hold considerable potential, the health effects associated with exposure are not yet clearly understood.

Exposure to nanomaterials can occur through inhalation, absorption, injection, or ingestion. Toxicity will depend on the route of exposure and physical and chemical properties of the nanomaterial. Nanomaterials with known hazardous properties (e.g., carcinogens, mutagens, reproductive toxicants, sensitizers, reactive metals, etc.) as well as those that are photo-reactive, have highly-charged surfaces, are highly acidic/basic, soluble, fibrous (i.e., possess a high aspect ratio), and/or have other hazardous properties require further assessment and control measures.

The table below provides a general overview of nanomaterial activities, exposure sources, and engineering controls. Principal investigators or laboratory/facility managers must determine the appropriate engineering controls, work practices, and personal protective equipment necessary for the operations and nanomaterials specific to their labs.
Table 34. Nanomaterial-Related Activities in Labs and Controls

*Table derived from DHHS (NIOSH) Publication Number 2012-147.

Prior to research, principal investigators or laboratory/facility managers must evaluate and take measures to control:
• The procedure or operation,
• The ability of the material to become airborne,
• The frequency, duration and quantity of the nanomaterials being used,
• Cleaning and maintenance procedures,
• Storage,
• Emergency response procedures, and
• Waste management.

1. Engineering Controls

• All research involving nanomaterials should take place in a properly-functioning fume hood, glove box, ventilated enclosure or other form of local exhaust, unless a risk assessment by the principal investigator determines ventilation is not required and the nanomaterials in use pose no risk to lab personnel.
• Positive pressure laminar flow hoods are not recommended for protection from nanomaterials.
• High-efficiency particulate air (HEPA) filters should be used for removal and/or cleaning of areas contaminated by nanomaterials.

2. Work Practices

• Lab personnel working with engineered nanomaterials must receive training on the associated hazards and risks. Documentation of training is recommended.
• Review the safety data sheet(s) prior to use.
• Avoid manipulating nanomaterials in open systems or in a free particle state (e.g., handling dry nano powders on a benchtop).
• Whenever possible, handle nanomaterials attached to substrates or in solutions to minimize airborne release.
• Avoid creating large, highly concentrated aerosols of combustible no materials.
• Store liquid and solid nanomaterials in unbreakable, tightly sealed containers.
• Label secondary containers with a chemical name and hazard class(s), if applicable. Use the word “Nano” to differentiate from other containers.
• Close or cover all containers when not in use.
• Work in an isolated area of the lab, preferably in a fume hood or approved ventilated enclosure. Post appropriate warnings to notify other lab personnel of the risks.
• Clean all working surfaces potentially contaminated with nanomaterials at the end of each experiment and the end of each day with a HEPA vacuum and/or wet wiping. **Do not dry sweep or use compressed air.**
3. **Personal Protective Equipment**

- Wear all personal protective equipment (PPE) specified in the safety data sheet(s) and *Workplace Hazard Assessment Form*.
- At a minimum, ANSI-approved chemical safety goggles or glasses with side shields must be worn while working with nanomaterials.
- Wear gloves impervious to the materials and/or chemicals being used.
- Wear long sleeve shirts, lab coats, and clothing that covers the legs (without cuffs).
- Gloves should be removed inside the fume hood or under local ventilation and placed in sealed bags to prevent nanoparticles from becoming airborne.
- Principal investigators or laboratory/facility managers must determine when respiratory and face protection in conjunction with safety goggles/glasses are required based on the hazards and quantities of the material(s) handled, the availability of appropriate controls, and the exposure risks.
- Lab personnel required to wear respirators must comply with all requirements of the *UConn Respirator Program*.
- Wear closed-toed footwear. Disposable, over-the-shoe booties may be necessary to prevent tracking nanomaterials from the lab.

J. **Thorium and Uranium Compounds**

Thorium and uranium compounds (e.g., thorium acetate, thorium nitrate, uranyl acetate, uranyl nitrate, etc.) are regulated as radioactive source material by the Nuclear Regulatory Commission (NRC). Lab personnel purchasing thorium and uranium compounds must report the quantities and location(s) to Radiation Safety. Radiation Safety is required to include the amounts of thorium and uranium in the overall UConn Health inventory. Failure to contact Radiation Safety prior to ordering may result in UConn Health exceeding regulatory limits. In order to minimize total quantities, Radiation Safety requires:

- Contacting Radiation Safety with the name and gram weight of the compound prior to ordering,
- Purchasing the smallest quantity for the desired application, and
- Sharing stocks from other researchers (Radiation Safety can provide a list of researchers possessing thorium and uranium compounds upon request).
Barcodes on empty chemical bottles previously containing thorium and uranium compounds must be sent to EH&S prior to disposal for compliance with the Laboratory Chemical Inventory Program. Unwanted thorium and uranium compounds or waste containing thorium and uranium must be disposed of through Radiation Safety.

XIV. Laboratory Equipment

Departments, principal investigators, laboratory/facility managers, lab personnel, and other individuals working in labs are responsible for proper use and maintenance of equipment used in laboratories. All repair and calibration work on laboratory equipment must be carried out by properly trained and qualified personnel. Equipment used in labs must be installed and maintained as specified by the manufacturer.

In addition to the general work practices for lab equipment listed below, lab personnel must also follow the manufacturer’s guidelines for equipment specific to their labs.

Equipment deemed unrepairable and potentially contaminated (chemical, radiological, biological, imbedded hazard) must be cleared by EH&S prior to disposal. All refrigerant containing equipment must be purged by Facilities Development & Operations prior to disposal by Logistics Management.

A. Centrifuges

- Follow the manufacturer’s instructions for safe operation.
- Ensure tubes or containers are balanced, hung properly, and not overfilled.
- Inspect tubes or containers for cracks or flaws before using them.
- Ensure that the lid is closed before starting the centrifuge.
- The disconnect switch should automatically shut off the centrifuge when the top is opened.
- Do not exceed a rotor’s maximum rated speed.
- Do not overload a rotor beyond its maximum mass without reducing the rated rotor speed.
- Check O-rings and grease the seals per manufacturers specifications.
- Clean the rotors as specified by the manufacturer.
- Use only the rotor(s) specified by the manufacturer. Change old rotors as advised by manufacturer.
- Use local exhaust ventilation for samples containing flammable and/or hazardous materials.
Inspect the components of the centrifuge each time it is used. Replace parts if signs of corrosion or cracks on the rotors, cone area, and/or tube cavity are evident.

B. Heating Equipment

- Follow the manufacturer’s instructions for safe operation.
- Never use laboratory ovens to prepare food for human consumption.
- Do not use ovens to dry volatile chemicals samples.
- Do not dry glassware that has been rinsed with an organic solvent in an oven.
- Ovens must be exhausted as required by manufacturer’s specifications.
- Bimetallic strip thermometers are preferred for monitoring oven temperatures. Mercury thermometers are not recommended.
- Use only hot plates with fully enclosed heating elements.
- Do not store flammable materials near hotplates.
- Use only heating mantles with a variable autotransformer to control the input voltage. Never plug them directly into a 110-V line.
- Never exceed the input voltage recommended by the mantle manufacturer.
- Avoid using water or other volatile substances near oil, salt, or sand baths.
- Monitor oil baths using a thermometer or other thermal sensing device to ensure temperatures do not exceed the flash point of the oil being used.
- Use thermal-sensing devices that turn off electric power to prevent overheating if an oil bath must be left unattended.
- Thermocouples used by controlling devices must be clamped securely in place to maintain contact with the medium or object being heated at all times.
- Mount oil baths on a stable horizontal support such as laboratory jacks. Avoid use of iron rings.
- Metal pans or heavy-walled porcelain dishes are preferred over Pyrex glassware for containing oil baths.
- Do not heat sealed containers or metal-containing objects in a microwave.
- Never operate microwave ovens with the doors open.
- Never use heat guns in areas with flammable liquids or vapors.

C. Pressure and Vacuum Systems

- Follow the manufacturer’s instructions for safe operation.
- Procedures involving high pressure vacuum systems should be carried out in a properly functioning chemical fume hood.
- Principal investigators or laboratory/facility managers must determine if shielding of the operation is required.
- Ensure glass vessels are designed for the intended operation.
- Inspect glass vessels for cracks, scratches, or etching marks before each use.
- Do not allow water, solvents, and/or corrosive gases to be drawn into vacuum systems.
- Distillation or similar operations requiring a vacuum must use a trapping device.
- Vacuum pumps must be vented to a suitable exhaust system.
- Vacuum pump oil must be drained and replaced when it becomes contaminated. All pump oil must be collected and disposed of by EH&S.
- Belt-driven mechanical pumps must have protective guards.
- Drip pans are required to minimize spills and must be cleaned regularly.

D. Refrigerators and Freezers

- Follow the manufacturer’s instructions for safe operation.
- Flammable chemicals must be stored in an approved explosion-proof or flammable storage refrigerator or freezer.
- Chemicals stored in refrigerators or freezers must be compatible. Limited quantities of incompatible hazard classes that require refrigeration must be segregated in separate secondary containment bins with tight-fitting caps or lids.
- Do not plug refrigerators or freezers into extension cords or power strips.
- Never store uncapped or partially opened containers (e.g., chemicals covered with aluminum foil, glass stoppers, wooden corks, etc.) of chemicals in a refrigerator.
- Samples stored in refrigerators must be appropriately labeled.

E. Miscellaneous Equipment

- All equipment not referred to in the CHP must be operated in accordance with the manufacturer’s specifications.
- Equipment with moving or rotating parts must be appropriately guarded or enclosed.
  
  Equipment that generates strong magnetic fields, such as a nuclear magnetic resonance (NMR) system, must exclude ferromagnetic objects from the immediate vicinity of the magnet.
- Equipment that exposes lab personnel to radioactive isotopes, X-Rays or sources (e.g., electron capture detectors in gas chromatographs, liquid scintillation counters, etc.) must be in full compliance with Radiation Safety.
- Labs that use Class 3B and 4 lasers must contact Radiation safety x-2250 for prior approval.
XV. Medical Consultation and Medical Examinations

Principal investigators, laboratory/facility managers, and lab personnel working in laboratories at UConn Health must be afforded medical attention, including follow-up examinations, deemed necessary by the examining physician, under the following circumstances:

- Whenever an employee develops signs or symptoms associated with a hazardous chemical exposure;
- Where exposure monitoring reveals an exposure level above the action level (or in the absence of an action level, the PEL) for an OSHA regulated substance for which there are exposure monitoring and medical surveillance requirements;
- Whenever an accident such as a spill, leak, fire, explosion, or other occurrence results in the likelihood of a hazardous exposure; or
- At the request of the UConn Health Chemical Hygiene Officer.

All medical examinations and consultations shall be performed by or under the direct supervision of a licensed physician. Medical exams/consultations must be conducted within a reasonable timeframe from the date the incident occurred and shall be provided without cost or loss of pay to the employee. These services are available at UConn Health’s Occupational and Environmental Medicine Clinic.

XVI. Records and Recordkeeping

UConn Health is required to maintain an accurate record of any exposure monitoring results required to assess employee exposures to toxic or harmful chemicals in the course of employment in accordance with 29 CFR 1910.1020, Access to employee exposure and medical records. Environmental Health and Safety maintains records of the following information:

- Exposure monitoring results,
- Training,
- Fume hood inspections, and
- Laboratory inspections.

Exposure monitoring results shall be preserved and maintained for at least 30 years. EH&S also maintains separate databases regarding employee training, fume hood inspections, and laboratory inspections.
